3. Repeat Step 2 two additional times, for a total of thirty minutes. All previously known transmitters have now been unlearned. Remaining transmitters can be relearned during the next steps. The driver information center display will now display Ready For Remote # 1.

NOTE:

The transmitter pocket is located inside the center console storage area, near the front of the storage compartment. If a large keyring prevents the transmitter from being placed fully into the pocket, remove the keyring and place the transmitter in the pocket. Failure to lay the transmitter fully into the pocket may result in an inability to program.

4. Place the new transmitter into the transmitter pocket.
5. Press and release the ignition mode switch. When the transmitter is learned, the driver information center will indicate that it is ready to program the next transmitter.
6. Remove the transmitter from the transmitter pocket and press the unlock button. To program additional transmitters, repeat Steps 4 through 6.

7. When all additional transmitters are programmed, press and hold the ignition mode switch for 15 seconds to exit programming mode.
8. Verify each transmitter and key is operating properly. Operate each of the keyless entry functions using the buttons on the transmitter. On vehicles with a keyed ignition switch, verify the mechanical key by starting the vehicle using the ignition switch. When verifying operation, make sure that no other transmitters are near the vehicle.

Replacing Transmitters (With SPS)

NOTE:

- **Verify all mechanical keys operate correctly before beginning any programming procedures.**
- **This procedure will unlearn all previously learned transmitters. All transmitters that are to be programmed must be with the vehicle.**
- **This procedure may be used with or without existing learned transmitters being present.**
- **This procedure will take more than 15 minutes to complete.**
- **A total of eight transmitters can be learned to a single vehicle.**
- **This procedure will only learn the vehicle transmitter information. This procedure will not learn any immobilizer information between the body control module (BCM) and engine control module (ECM).**
- **If the battery voltage is low, charge the battery before continuing with the procedure.**

1. Connect a scan tool to the vehicle and access SPS.
2. Ensure that all power consuming devices are turned OFF on the vehicle.
3. Select the SPS application and follow the on-screen instructions.
4. Select Reprogram ECU.
5. Select IMMO Immobilizer Learn - Setup.
6. Select the Program Transponder or Remote Key (Delete) function.

NOTE:

- **At multiple times during the learn procedure, SPS will instruct you to turn the ignition to the run position. Make sure the vehicle is actually in the run mode before continuing on the SPS terminal. If the vehicle is not in the run mode, the learn procedure will fail. To verify the vehicle is in Run mode, verify the green LED is illuminated on the ignition mode switch.**
- **The transmitter pocket is located inside the center console storage area, near the front of the storage compartment. If a large keyring prevents the transmitter from being placed fully into the pocket, remove the keyring and place the transmitter in the pocket. Failure to lay the transmitter fully into the pocket may result in an inability to program.**

7. Follow the on-screen instructions.

8. After programming all transmitters, Programming Complete, is displayed.
9. Press and hold the ignition mode switch for 15 seconds.
10. Press the lock and unlock button on each transmitter that was programmed. This will awaken each transmitter and allow passive and active keyless entry functions to be established.
11. With a scan tool, clear any DTCs.
12. Verify each transmitter and key is operating properly. Operate each of the keyless entry functions using the buttons on the transmitter. On vehicles with a keyed ignition switch, verify the mechanical key by starting the vehicle using the ignition switch. When verifying operation, make sure that no other transmitters are near the vehicle.

Adding Transmitters (Without SPS)

NOTE:

- **Verify all mechanical keys operate correctly before beginning any programming procedures.**
- **To initiate, this procedure requires that 1 learned transmitter be available.**
- **A total of eight transmitters can be learned to a single vehicle.**
- **This procedure adds transmitters only. The procedure does not erase previously learned transmitters.**

1. Place the recognized transmitter(s) in the vehicle cupholder.
2. Insert the mechanical key of the new transmitter into the key lock cylinder located on the outside of the driver door and turn the key to the unlock position five times within ten seconds. The driver information center will display Ready For Remote #2, 3, 4, etc.

NOTE:

The transmitter pocket is located inside the center console storage area, near the front of the storage compartment. If a large keyring prevents the transmitter from being placed fully into the pocket, remove the keyring and place the transmitter in the pocket. Failure to lay the transmitter fully into the pocket may result in an inability to program.

3. Place the new transmitter into the transmitter pocket.
4. Press and release the ignition mode switch. When the transmitter is learned, the driver information center will indicate that it is ready to program the next transmitter.
5. Remove the transmitter from the transmitter pocket and press the transmitter unlock button. To program additional transmitters, repeat Steps 3 through 5.
6. When all additional transmitters are programmed, press and hold the ignition mode switch for 15 seconds to exit programming mode.
7. Verify each transmitter and key is operating properly. Operate each of the keyless entry functions using the buttons on the transmitter. On vehicles with a keyed ignition switch, verify the mechanical key by starting the vehicle using the ignition switch. When verifying operation, make sure that no other transmitters are near the vehicle.

Adding Transmitters (With SPS)

NOTE:

- **Verify all mechanical keys operate correctly before beginning any programming procedures.**
- **This procedure may be used with or without existing learned transmitters being present.**
- **This procedure will take more than 15 minutes to complete.**
- **A total of eight transmitters can be learned to a single vehicle.**
- **This procedure will only learn the vehicle transmitter information. This procedure will not learn any immobilizer information between the body control module (BCM) and engine control module (ECM).**
- **If the battery voltage is low, charge the battery before continuing with the procedure.**

1. Connect a scan tool to the vehicle and access SPS.
2. Ensure that all power consuming devices are turned OFF on the vehicle.
3. Select the SPS application and follow the on-screen instructions.
4. Select Reprogram ECU.
5. Select IMMO Immobilizer Learn - Setup.
6. Select the Program Transponder or Remote Key (Add) function.

NOTE:

- **At multiple times during the learn procedure, SPS will instruct you to turn the ignition to the run position. Make sure the vehicle is actually in the run mode before continuing on the SPS terminal. If the vehicle is not in the run mode, the learn procedure will fail. To verify the vehicle is in Run mode, verify the green LED is illuminated on the ignition mode switch.**
- **The transmitter pocket is located inside the center console storage area, near the front of the storage compartment. If a large keyring prevents the transmitter from being placed fully into the pocket, remove the keyring and place the transmitter in the pocket. Failure to lay the transmitter fully into the pocket may result in an inability to program.**

7. Follow the on-screen instructions.
8. After programming all transmitters, Programming Complete, is displayed.
9. Press and hold the ignition mode switch for 15 seconds.
10. Press the lock and unlock button on each transmitter that was programmed. This will awaken each transmitter and allow passive and active keyless entry functions to be established.
11. With a scan tool, clear any DTCs.
12. Verify each transmitter and key is operating properly. Operate each of the keyless entry functions using the buttons on the transmitter. On vehicles with a keyed ignition switch, verify the mechanical key by starting the vehicle using the ignition switch. When verifying operation, make sure that no other transmitters are near the vehicle.

DESCRIPTION AND OPERATION

GARAGE DOOR OPENER DESCRIPTION AND OPERATION

The garage door opener is fixed and rolling code capable. Rolling code is a system that allows the code that the customers receiver receives from the garage door opener to change every time the garage door opener is used within operating range of the receiver. Rolling code programming requires the customer to push a learn/program button on the garage door opener receiver at their home. This button is usually located on the receiver unit under a cover (light cover) on one end of the unit. The customer must follow the garage door opener manufacturers instructions to program/learn the receiver to accept the Universal Home Remote System as an authorized opener for their unit. When the receiver and the garage door opener are initially programmed together, a code is established and a new code is created for every new transmission. The software in the receiver recognizes the garage door opener and accepts the new code.

The garage door opener is compatible with most, but not all types and brands of transmitters.

The garage door opener is a transmitter operating between 288 - 434 MHz. The power and range of the transmitter is limited to comply with laws governing the generation of radio frequency interference. The transmitter is programmed by the user to accept the signal generated by the user's transmitters.

The garage door opener has 3 buttons that may be programmed for individual transmitter/receiver combinations to control up to 3 garage door openers, security gates, lighting systems, etc. Each button represents a transmitter code section of the transmitter, which operates separately from any other button, and may be considered a separate transmitter. Operation consists of simply pressing a button to activate the corresponding transmitter.

NOTE: Do not use the garage door opener (GDO) with any garage door opener that does not have the stop and reverse safety feature. This includes any garage door opener model manufactured before April 1, 1982.

KEYLESS ENTRY SYSTEM DESCRIPTION AND OPERATION

15	Keyless Entry Transmitter

Keyless Entry System Description and Operation - Active

The keyless entry system is a vehicle entry device. The keyless entry system is used in conjunction with the door locks to unlock the vehicle. Keyless entry will lock/unlock the vehicle doors or open the rear compartment

lid when a corresponding button on the keyless entry transmitter is pressed. This is accomplished by the transmitter sending a radio frequency to the remote control door lock receiver antenna that has a direct link to the body control module (BCM). The BCM interprets the signal and activates the requested function or requests the appropriate control module to activate the function via a serial data message. A low transmitter battery or radio frequency interference from aftermarket devices, such as 2-way radios, power inverters, computers, etc., may cause a system malfunction. High radio frequency traffic areas, such as gas stations that use pay-at-the-pump radio frequency transponders, may also cause interference that could lead to a malfunction. Keyless entry allows you to operate the following features:

- Door lock/unlock
- Remote start
- Charge port door release
- Illuminated entry lamps
- Panic alarm/vehicle locator
- Remote vehicle start

Keyless Entry System Description and Operation - Passive

Passive keyless entry allows entry to a locked vehicle without pressing any buttons on the keyless entry transmitter. You must only have the transmitter with you. The passive entry system use low frequency antennas in several different areas on the vehicle to determine the location of the transmitter. When passively opening a locked door or the rear compartment, you must have a programmed transmitter with you in your pocket, purse, or briefcase.

When an exterior door handle button is pressed or the rear compartment touch pad is pressed, the low frequency antenna sends out a challenge to the keyless entry transmitter. Because of the low frequency, communication range is limited. The antenna will emit the challenge in a one meter range. The transmitter must be within this range to receive the challenge. The transmitter receives this challenge and emits it's response as an RF message, which is received by the remote control door lock receiver. If the response is correct, the door or rear compartment will unlock and open.

As a customer convenience feature, the keyless entry system will notify the driver if the transmitter has been left in the vehicle after exiting by chirping the vehicle horn three times. This may be turned off using vehicle personalization. Also, if the transmitter is left in the vehicle after the central door lock switch has been used to lock the vehicle, the driver door will remain unlocked after exiting the vehicle. This is intended to prevent locking the transmitter in the vehicle and being unable to access it.

Keyless Entry System Description and Operation - Keyless Start

The keyless start portion of the keyless entry system allows vehicle starting, having only the transmitter as your key. The keyless start system uses low frequency antennas in three different locations on the vehicle to determine the location of the transmitter. Multiple antennas are used to ensure complete coverage of the vehicle interior and rear compartment. When using the keyless start system, a programmed transmitter must be in the vehicle's interior, such as the driver's pocket, purse, or briefcase.

When the ignition mode switch is pressed, the low frequency antennas emit a challenge to the keyless entry transmitter. The transmitter receives this challenge and emits it's response as an RF message, which is received by the remote control door lock receiver. If the response is correct, vehicle starting will be allowed. If RF

communication is interrupted, a "No Remote Detected" message will be displayed on the DIC. In these cases, the extended transmitter key blade can be placed in the transmitter slot located in the upper instrument panel storage compartment, under the rubber mat. The immobilizer antenna coil is located directly beneath the transmitter slot. Placing the extended key blade in the slot will create a low powered coupling between the transmitter and immobilizer antenna, allowing communications to occur and enabling vehicle starting.

The keyless entry system has the following components:

- Vehicle key with integrated keyless entry transmitter
- Driver and front passenger door antennas (part of the door handle assembly)
- Driver and front passenger door handle switches (part of the door handle assembly)
- Rear fascia antenna
- Front instrument panel console antenna
- Center console antenna
- Rear compartment antenna
- Body control module (BCM)
- Keyless entry control module
- Immobilizer antenna coil
- Remote control door lock receiver

Keyless Entry Transmitters

The keyless entry transmitters are used to lock and unlock the vehicle door while away from the immediate area of the vehicle. Keyless entry functions may work at up to 20 m (65 ft) from the vehicle. The keyless entry transmitter is an integral part of the vehicle key.

Door Antenna

The keyless entry door antennas are used to transmit low frequency communications to the keyless entry transmitters.

The keyless entry door antennas are located in the left front and right front exterior door handle bracket. The antennas are serviced as part of the door handle assembly. The antennas are controlled by the keyless entry control module. When the exterior door handle button is pressed, the respective antenna will send out a challenge to the keyless entry transmitter, which begins the passive entry communications.

Rear Fascia Antenna

The rear fascia antenna is used to transmit low frequency communication to the keyless entry transmitters for entry to rear compartment.

The rear fascia antenna is located behind the rear fascia. The antenna is controlled by the keyless entry control module. When the rear compartment touch pad is pressed, the antenna sends out a challenge to the keyless entry transmitter, which begins the passive entry communications.

Front Console Passive (Instrument Panel) Antenna

This antenna is located in the lower instrument panel near the front of the center console.

The front console antenna is used for vehicle starting functions. When the ignition mode switch is pressed, the antenna is energized or "pinged". This emits a low frequency challenge signal that is received by the keyless entry transmitter. The transmitter will then reply to this challenge with a response and, if correct, vehicle starting will occur.

Center Console Antenna

This antenna is located in the rear of the center console.

The rear console antenna is used for vehicle starting functions. When the ignition mode switch is pressed, the antenna is energized or "pinged". This emits a low frequency challenge signal that is received by the keyless entry transmitter. The transmitter will then reply to this challenge with a response and, if correct, vehicle starting will occur.

Rear Compartment Antenna

This antenna is located in the center of the rear compartment metal floor pan, near the seatback.

The rear compartment antenna is used for vehicle starting functions. When the ignition mode switch is pressed, the antenna is energized or "pinged". This emits a low frequency challenge signal that is received by the keyless entry transmitter. The transmitter will then reply to this challenge with a response and, if correct, vehicle starting will occur.

Remote Control Door Lock Receiver

The remote control door lock receiver is located on the vehicle windshield, directly in front of the inside rearview mirror.

The remote control door lock receiver is control by and directly communicates with the body control module (BCM). When the transmitter receives a low frequency challenge from an antenna, it responds with an RF message. This RF message is received by the remote control door lock receiver and communicated to the BCM. If the RF message is a valid response to the low frequency challenge, vehicle access or starting will be allowed.

Immobilizer Antenna Coil Assembly

The keyless entry immobilizer coil assembly is located in the upper instrument panel, directly beneath the upper instrument panel storage compartment. If the transmitter battery is dead, weak, or the RF signal is being interrupted, the extended transmitter key blade can be placed in the transmitter slot located in the upper instrument panel storage compartment, under the rubber mat, to create a low powered coupling between the transmitter and immobilizer antenna, allowing communications to occur and enabling vehicle starting.

The immobilizer antenna coil is controlled by the BCM. The immobilizer control module is also active when learning vehicle keys.

Keyless Entry Control Module

The keyless entry control module is a multi-function module which performs the following keyless entry system functions:

- Activating vehicle antennas for passive keyless entry functions
- Activating vehicle antennas for keyless start functions

- Backup control for the ECM accessory wakeup and the run/crank relay
- If equipped, controls the electronic steering column lock
- Receiver of the exterior door handle switch inputs and door open switch (not the door ajar switch)
- Ignition mode switch monitoring

OnStar® Remote Link (if equipped)

A vehicle operator may have the ability to perform some of the keyless entry functions using applications on personal devices such as but not limited to smart phones. A condition may appear as if there is a malfunction in the vehicle. If it is suspected that this may be the case contact Technical Assistance if a condition cannot be determined through normal vehicle diagnostics.

Body Control Module (BCM)

The BCM is a multi-function module that performs the following functions:

- Receive and authenticate active transmitter and keyless start signals from the remote control door lock receiver
- Determines the functionality requested by the transmitter signal
- Performs the function requested by the transmitter signal

Unlock Driver Door Only - Active

Momentarily press the transmitter UNLOCK button to perform the following functions:

- Unlock only the driver door
- Illuminate the interior lamps for a determined length of time or until the ignition mode switch is pressed
- Flash the exterior lights, if enabled through personalization
- Disarm the content theft deterrent system
- Deactivate the content theft deterrent system when in the alarm mode

Unlock All Doors - Second Operation - Active

Momentarily press the transmitter UNLOCK button a second time, within 5 seconds of the first press, to perform the following function:

Unlock the remaining doors and rear compartment

Unlock Driver Door Only - Passive

If enabled through personalization, approach the driver door with a valid keyless entry transmitter and press the door handle button to perform the following functions:

- Unlock and open only the driver door when door handle is operated
- Disarm the content theft deterrent system, if equipped
- Deactivate the content theft deterrent system when in the alarm mode

Unlock All Doors - Passive

Approach any non driver door (front or rear) or, if enabled through personalization, the driver door with a valid keyless entry transmitter and press the door handle button to perform the following functions:

- Unlock all vehicle doors and rear compartment
- Disarm the content theft deterrent system, if equipped
- Deactivate the content theft deterrent system when in the alarm mode

Lock All Doors - Active

Press the transmitter LOCK button to perform the following functions:

- Lock all vehicle doors
- Immediately turn off the interior lamps
- Flash the exterior lights, if enabled through personalization
- Chirp the horn, if enabled through personalization
- Arm the content theft deterrent system

Lock All Doors - Passive

Exit the vehicle (with vehicle off) with the keyless entry transmitter to automatically perform the following functions, if equipped.

- Lock all vehicle doors and rear compartment after a delay
- Flash the exterior lights, if enabled through personalization
- Chirp horn, if enabled through personalization
- Arm the content theft deterrent system

When all doors are closed, they can also be locked from the exterior by pressing the door handle button while having a valid transmitter within range.

If more than one keyless entry transmitter is within a vehicle and the keyless entry system detects that one or more transmitters have been left in the vehicle after vehicle is locked, any transmitter left within the vehicle will be temporarily deactivated until:

- A button on the deactivated transmitter is pressed (will only activate the transmitter whose button is pressed)
- A passive unlock of vehicle occurs
- Change in power mode occurs

Rear Compartment Release - Passive

Approach the rear of the vehicle with a valid keyless entry transmitter. Press the trunk release touch pad. The trunk will open.

Vehicle Locator/Panic Alarm/Active

A single press of the panic button performs the following functions. Some functions may be dependent on personalization settings:

- Pulses the horn three times
- Flashes the exterior lamps three times

A press and hold of the panic button performs the following functions:

- Pulses the horn and flashes the parking lamps for 30 second or until the following conditions occur:
 - The panic button is pressed
 - The ignition mode switch is pressed with a valid key in the vehicle

Remote Start

The remote vehicle start function allows engine starting while not in the vehicle. It also allows the vehicle HVAC system and other vehicle systems to enable, providing a comfortable vehicle upon entry. The remote vehicle start sequence begins by pressing and releasing the lock button and then pressing and holding the remote vehicle start buttons on the keyless entry transmitter. The turn signal lamps will illuminate to indicate the vehicle has received the remote start request. Each time a remote vehicle start is performed, the vehicle doors are locked, however they may then be unlocked/locked with the transmitter at any time. Only the first and second vehicle transmitters are able to control the remote vehicle start function. Any additional remote transmitters programmed to the vehicle will perform all other remote functions. Once activated, the engine is allowed to run for 10 minutes. The remote vehicle start time may be extended by an additional 10 minutes by again pressing and releasing the lock button and then pressing and holding the remote vehicle start buttons on the transmitter. This feature is called a remote vehicle start continue and allows a maximum of 20 minutes of engine running. If the remote vehicle start continue is performed at 7 minutes into the initial 10 minute time-out, a total of 17 minutes of engine running would occur. The remote vehicle start event may be suspended at any time by pressing only the remote vehicle start button on the transmitter or by entering the vehicle and turning ON the hazard lamps.

In between ignition cycles, only two remote start events may occur or be attempted. Once two events or attempts have been made, future remote start events will be suspended until the vehicle is operated using the ignition mode switch.

Enable/Disable Remote Start

Using the driver information center, remote start may be enabled or disabled as a part of vehicle personalization. Refer to the vehicle owners manual for more information.

Remote Start System Disabled

If any of the conditions listed below occur, a remote start event may be aborted or canceled:

- Vehicle is in valet mode
- Vehicle doors are ajar
- Rear compartment lid is ajar
- The hood is open
- The doors are not locked
- The hazard switch is ON
- Vehicle power mode is incorrect
- Vehicle speed is greater than 0

- Transmission is not in P
- Excessive engine coolant temperature
- Low oil pressure
- The malfunction indicator lamp (MIL) is commanded ON
- The low fuel level indicator lamp is commanded ON
- Engine crank time is greater than 30 seconds
- Excessive engine speed
- Accelerator pedal position too high
- Remote start timer equals 0
- Immobilizer system indicates a theft attempt
- Vehicle propulsion system fault conditions
- High voltage battery fault conditions

Keyless Entry Personalization

Vehicle lock/unlock functions and remote start settings may be personalized for the vehicle. For functional descriptions and programming instructions, refer to the vehicle owners manual.

Replace Battery in Remote Key Message

A REPLACE BATTERY IN REMOTE KEY message may be seen on the driver information center when the transmitter's battery voltage has been lower than 2.16 volts for three consecutive ignition cycles.

Rear Seat Back Cushion Hinge Fastener	45 N.m (33 lb ft)
Rear Seat Back Latch Fastener	45 N.m (33 lb ft)

DIAGNOSTIC INFORMATION AND PROCEDURES

SEAT - HARD TO MOVE FORWARD AND REARWARD

Condition	Action
NOTE: Replace all seat adjusters as an assembly. Replace both sides at	

the same time.	
The adjusters are not in parallel alignment with each other.	1. Loosen the floor pan attaching bolts. 2. Position the seat fully forward. 3. Tighten the bolts. Refer to Driver or Passenger Seat Removal and Installation.

SEATS - ADJUSTER TRACK LOCKS AHEAD OF OTHER TRACK

Condition	Action
NOTE: Replace all seat adjusters as an assembly. Replace both sides at the same time.	
The adjusters are out of time.	Remove and reinstall the front bucket seat. Refer to Driver or Passenger Seat Removal and Installation .

REPAIR INSTRUCTIONS

DRIVER OR PASSENGER SEAT REMOVAL AND INSTALLATION

Fig. 1: Driver or Passenger Seat
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Refer to SIR Warning .	
Preliminary Procedures 1. Disable SIR system. Refer to SIR Disabling and Enabling 2. Disconnect the seat belt from the tensioner. Refer to Front Seat Belt Retractor Replacement	
1	Driver or Passenger Seat Bolt (Qty: 4) CAUTION: Refer to Fastener Caution . Procedure Adjust the seat to the full forward position to gain access to the rear bolts. Tighten 45 N.m (33 lb ft)

Callout	Component Name
2	Driver or Passenger Seat Procedure 1. Disconnect the electrical connector. 2. With the aid of an assistant, remove the front seat.

DRIVER OR PASSENGER SEAT INNER ADJUSTER FRONT FINISH COVER REPLACEMENT

Fig. 2: Driver or Passenger Seat Inner Adjuster Front Finish Cover
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Driver or Passenger Seat. Refer to Driver or Passenger Seat Removal and Installation	
1	Driver or Passenger Seat Inner Adjuster Front Finish Cover Fastener (Qty: 2) CAUTION: Refer to Fastener Caution . Tighten

Callout	Component Name
	2.5 N.m (22 lb in)
2	Driver or Passenger Seat Inner Adjuster Front Finish Cover Procedure Use a suitable tool to separate the seat inner adjuster front finish cover.

DRIVER OR PASSENGER SEAT ADJUSTER VERTICAL ACTUATOR HANDLE REPLACEMENT

Fig. 3: Driver or Passenger Seat Adjuster Vertical Actuator Handle
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Driver or Passenger Seat Adjuster Handle. Refer to Driver or Passenger Seat Adjuster Handle Replacement	
1	Front Seat Vertical Actuator Handle Cap
2	Front Seat Vertical Actuator Handle Fastener (Qty: 2) CAUTION: Refer to Fastener Caution . Tighten 2.5 N.m (22 lb in)

Callout	Component Name
3	Driver or Passenger Seat Vertical Actuator Handle

DRIVER OR PASSENGER SEAT ADJUSTER HANDLE REPLACEMENT

Fig. 4: Driver or Passenger Seat Adjuster Handle

Callout	Component Name
1	Front Seat Adjuster Finish Cover Bolt Cap
2	Front Seat Adjuster Handle Fastener CAUTION: Refer to Fastener Caution . Tighten 2.5 N.m (22 lb in)
3	Front Seat Adjuster Handle

DRIVER OR PASSENGER SEAT HEAD RESTRAINT REPLACEMENT

Fig. 5: Driver or Passenger Seat Head Restraint
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Driver or Passenger Front Seat Head Restraint Guide Bezel (Qty: 2) Procedure 1. Raise the headrest to gain access to the head restraint guide bezel. 2. Twist the bezel counter clockwise and push the bezel upward on the head restraint adjuster rod.
2	Driver or Passenger Seat Head Restraint Clip (Qty: 2) Procedure Using a suitable pointed or flat bladed tool, push the metal clip rearward while pulling upward on the head restraint.
3	Driver or Passenger Seat Head Restraint

FRONT SEAT BELT ANCHOR PLATE TENSIONER COVER REPLACEMENT

Fig. 6: Front Seat Belt Anchor Plate Tensioner Cover

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Seat Belt Anchor Plate Tensioner Cover Fastener CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2.5 N.m (22 lb in)
2	Front Seat Belt Anchor Plate Tensioner Cover Procedure Unclip and reposition the electrical harness from the seat belt anchor plate tensioner cover.

DRIVER OR PASSENGER SEAT CUSHION FRAME REPLACEMENT

Fig. 7: Driver or Passenger Seat Cushion Frame

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Refer to SIR Warning .	
Preliminary Procedures 1. Remove Driver or Passenger Seat. Refer to Driver or Passenger Seat Removal and Installation 2. Remove Front Seat Belt Anchor Plate Tensioner. Refer to Front Seat Belt Anchor Plate Tensioner Replacement 3. Remove Front Seat Belt Buckle. Refer to Front Seat Belt Buckle Replacement 4. Remove Front Seat Cushion Cover and Pad. Refer to Front Seat Cushion Cover and Pad Replacement	
1	Driver or Passenger Seat Back Cushion Frame Bolt (Qty: 4) CAUTION: Refer to Fastener Caution .

Callout	Component Name
	Tighten 35 N.m (26 lb ft)
2	Driver or Passenger Seat Cushion Frame Procedure 1. Disconnect the electrical connector. 2. Transfer components as necessary.

FRONT SEAT CUSHION PAD SUPPORT REPLACEMENT

Fig. 8: Front Seat Cushion Pad Support
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Refer to SIR Warning . Preliminary Procedure Remove Front Seat Cushion Cover and Pad. Refer to Front Seat Cushion Cover and Pad Replacement	
1	Front Seat Cushion Pad Support Procedure Disconnect and reposition harness as necessary.

FRONT SEAT CUSHION OUTER FINISH COVER REPLACEMENT

Fig. 9: Front Seat Cushion Outer Finish Cover

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Driver or Passenger Seat Adjuster Vertical Actuator Handle. Refer to Driver or Passenger Seat Adjuster Vertical Actuator Handle Replacement	
1	Front Seat Cushion Outer Finish Cover Fastener (Qty: 3) CAUTION: Refer to Fastener Caution . Tighten 2.5 N.m (22 lb in)
2	Front Seat Cushion Outer Finish Cover Procedure Squeeze retainer to release.

FRONT SEAT CUSHION COVER AND PAD REPLACEMENT

Fig. 10: Front Seat Cushion Cover and Pad
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Refer to SIR Warning .	
Preliminary Procedures 1. Remove Driver or Passenger Seat. Refer to Driver or Passenger Seat Removal and Installation 2. Remove Driver or Passenger Seat Inner Adjuster Front Finish Cover. Refer to Driver or Passenger Seat Inner Adjuster Front Finish Cover Replacement 3. Remove Front Seat Cushion Outer Finish Cover. Refer to Front Seat Cushion Outer Finish Cover Replacement	
1	Front Seat Cushion Cover Procedure 1. Disengage the J-channel retainers from the seat cushion frame. 2. Disconnect the electrical connectors that attach to the seat cushion, if equipped. 3. Remove the seat cushion cover and pad from the seat cushion frame as an assembly. 4. Remove the hog rings and separate the seat cushion cover from the seat cushion pad by pulling the cover away from the pad.

Callout	Component Name
	5. If servicing the passenger seat, re-zero the passenger presence system. Refer to Passenger Presence System Rezeroing
2	Front Seat Cushion Heater Install Front Seat Cushion Heater. Refer to Front Seat Cushion Heater Replacement
3	Front Seat Cushion Pad

FRONT SEAT BACK CUSHION PAD SUPPORT REPLACEMENT

Fig. 11: Front Seat Back Cushion Pad Support
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Refer to SIR Warning .	
Procedure Remove Driver or Passenger Seat Back Cover and Pad. Refer to Driver or Passenger Seat Back Cover and Pad Replacement	
1	Front Seat Cushion Pad Support

DRIVER OR PASSENGER SEAT BACK COVER AND PAD REPLACEMENT

Fig. 12: Driver or Passenger Seat Back Cover and Pad

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Refer to SIR Warning . WARNING: Do not repair or replace the seat stitching or seams in the seat back trim cover with an internal mounted seat side airbag module. Replace the complete seat back trim cover	

Callout	Component Name
from the OEM. Non-OEM seat stitching may cause improper airbag deployment which could result in personal injury. Preliminary Procedures 1. Remove Driver or Passenger Seat. Refer to Driver or Passenger Seat Removal and Installation 2. Remove Driver or Passenger Seat Inner Adjuster Front Finish Cover. Refer to Driver or Passenger Seat Inner Adjuster Front Finish Cover Replacement 3. Remove Front Seat Cushion Outer Finish Cover. Refer to Front Seat Cushion Outer Finish Cover Replacement 4. Remove Driver or Passenger Seat Head Restraint. Refer to Driver or Passenger Seat Head Restraint Replacement	
1	Driver or Passenger Seat Back Cushion Cover Procedure 1. Disengage the j-channel retainers and tabs at the bottom of the seat back cover from the seat back cushion frame. 2. Disconnect the electrical connector that is attached to the seat back cushion, if equipped.
2	Front Seat Back Cushion Pad Procedure 1. Remove the hog rings. 2. Separate the seat cover from the seat cushion pad by pulling the cover away from the pad. 3. Transfer the seat heater, if equipped. NOTE: Seat back cover can be damaged upon

Callout	Component Name
	reinstalling cover to seat back pad. When reinstalling the seat cushion cover to the seat pad, start in upper outboard corner and install outboard side of the cover. Then start at the upper inboard corner and install inboard side of cover.

DRIVER OR PASSENGER SEAT BACK CUSHION PAD WIRE REPLACEMENT

Fig. 13: Driver or Passenger Seat Back Cushion Pad Wire

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures Remove Driver or Passenger Seat Back Cover and Pad. Refer to Driver or Passenger Seat Back Cover and Pad Replacement	
1	Driver or Passenger Seat Back Cushion Pad Wire Rivet (Qty: 2) WARNING: Use the proper eye protection when drilling to prevent metal chips from causing physical injury. Procedure Drill out all of the rivets before removing the pad wire.
2	Driver or Passenger Seat Back Cushion Pad Wire Procedure When re-installing the cushion pad wire, re-rivet at the same location on the cushion frame with new rivets.

DRIVER OR PASSENGER SEAT BACK CUSHION FRAME REPLACEMENT

Fig. 14: Driver or Passenger Seat Back Cushion Frame

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Refer to SIR Warning .	
Preliminary Procedures 1. Remove Driver or Passenger Seat. Refer to Driver or Passenger Seat Removal and Installation 2. Remove Driver or Passenger Seat Back Cover and Pad. Refer to Driver or Passenger Seat Back Cover and Pad Replacement	
1	Driver or Passenger Seat Back Cushion Frame Bolt (Qty: 4) CAUTION: Refer to Fastener Caution . Tighten 35 N.m (26 lb ft)

Callout	Component Name
2	Driver or Passenger Seat Back Cushion Frame Procedure 1. Disconnect the electrical connector. 2. Transfer components as necessary.

REAR SEAT ARMREST REPLACEMENT

Fig. 15: Rear Seat Armrest

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear Seat Armrest Cushion Cover
2	Rear Seat Armrest Fastener (Qty: 2) CAUTION: Refer to <u>Fastener</u> <u>Caution</u> . Tighten 3 N.m (27 lb in)

Callout	Component Name
3	Rear Seat Armrest Procedure Release the retainer on the hinge bracket.

REAR SEAT ARMREST BRACKET REPLACEMENT

Fig. 16: Rear Seat Armrest Bracket
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Rear Seat Back Cushion Cover and Pad. Refer to Rear Seat Back Cushion Cover and Pad Replacement (40%)Rear Seat Back Cushion Cover and Pad Replacement (60%)	
1	Rear Seat Armrest Bracket Fastener (Qty: 2) CAUTION: Refer to Fastener Caution . Tighten 3 N.m (27 lb in)
2	Rear Seat Armrest Bracket

REAR SEAT HEAD RESTRAINT REPLACEMENT

Fig. 17: Rear Seat Head Restraint
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear Seat Head Restraint Procedure 1. Lower the rear seat back forward to gain space between the head restraint and the roof. 2. Depress both buttons on the head restraint guides and pull upward to remove the head restraint from the seat.

REAR SEAT HEAD RESTRAINT GUIDE REPLACEMENT

Fig. 18: Rear Seat Head Restraint Guide

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
Remove Rear Seat Head Restraint. Refer to Rear Seat Head Restraint Replacement	
1	Rear Seat Head Restraint Guide (Qty: 2) Procedure Using a suitable flat-bladed tool, slide the tool on the inside of the guide until it finds the slot. Then push the tool forward pulling the guide tab inward, while pulling upward to remove the guide from the seat back frame.

REAR SEAT BACK BOLSTER REPLACEMENT

Fig. 19: Rear Seat Back Bolster

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Refer to SIR Warning .	
Preliminary Procedures 1. Disable SIR system. Refer to SIR Disabling and Enabling 2. Remove Rear Seat Cushion. Refer to Rear Seat Cushion Removal and Installation	
1	Rear Seat Back Bolster Fastener CAUTION: Refer to Fastener Caution . Tighten 9 N.m (80 lb in)
2	Rear Seat Back Bolster

REAR SEAT CUSHION COVER AND PAD REPLACEMENT

Fig. 20: Rear Seat Cushion Cover and Pad

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Rear Seat Cushion. Refer to Rear Seat Cushion Removal and Installation	
1	Rear Seat Cushion Cover Procedure Remove the hog rings, disconnect the j-channel retainer, and remove the push-in retainers that secure the rear seat cushion cover to the pad.
2	Rear Seat Cushion Heater Procedure Disconnect all electrical connectors.
3	Rear Seat Cushion Pad

REAR SEAT CUSHION REMOVAL AND INSTALLATION

Fig. 21: Rear Seat Cushion

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear Seat Cushion Procedure 1. Press inward on the two retainer tabs to release. These can be felt through a slot where the seat cushion cover meets the seat cushion pan. 2. Pull up on the front of the seat cushion and lift out of the vehicle. 3. {If equipped} Disconnect the electrical connectors.

REAR SEAT CUSHION FRAME REPLACEMENT

Fig. 22: Rear Seat Cushion Frame

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
Remove Rear Seat Cushion Cover and Pad. Refer to Rear Seat Cushion Cover and Pad Replacement	
1	Rear Seat Cushion Frame Procedure Transfer components as necessary.

REAR SEAT LATCH REPLACEMENT

Fig. 23: Rear Seat Latch

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Rear Seat Back Cushion Cover and Pad. Refer to Rear Seat Back Cushion Cover and Pad Replacement (40%) Rear Seat Back Cushion Cover and Pad Replacement (60%)	
1	Rear Seat Back Latch Fastener (Qty: 2) CAUTION: Refer to Fastener Caution . Tighten 45 N.m (33 lb ft)
2	Rear Seat Latch

REAR SEAT BACK CUSHION REMOVAL AND INSTALLATION (60%)

Fig. 24: Rear Seat Back Cushion (60%)

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove Rear Seat Back Bolster. Refer to Rear Seat Back Bolster Replacement 2. Remove the rear seat belt buckle nut. Refer to Rear Seat Belt Buckle Replacement	
1	Rear Seat Back Cushion Procedure 1. Pull the rear seat back cushion latch release located on the top of the rear seat back cushion, and fold the rear seat back cushion forward. 2. Push in on the rear seat back cushion pivot support, and release from bracket. 3. Pull up on the outer side of the rear seat back cushion and remove the rear seat back cushion from the bracket and hinge.

REAR SEAT BACK CUSHION REMOVAL AND INSTALLATION (40%)

Fig. 25: Rear Seat Back Cushion (40%)

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Rear Seat Back Bolster. Refer to Rear Seat Back Bolster Replacement	
1	Rear Seat Back Cushion Pivot Support Procedure 1. Pull the rear seat back cushion latch release located on the top of the rear seat back cushion, and fold the rear seat back cushion forward. 2. Push in on the rear seat back cushion pivot support, and release from bracket.
2	Rear Seat Back Cushion Procedure Pull up on the outer side of the rear seat back cushion and remove the rear seat back cushion from the bracket and hinge.

REAR SEAT BELT OPENING COVER REPLACEMENT

Fig. 26: Rear Seat Belt Opening Cover

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear Seat Belt Opening Cover Procedure 1. Using a suitable flat-bladed tool, push inward on the rear tabs while pulling upward. 2. Position the belt through the slot in the opening cover slot.

REAR SEAT BACK CUSHION COVER AND PAD REPLACEMENT (40%)

Fig. 27: Rear Seat Back Cushion Cover and Pad (40%)

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove Rear Seat Back Cushion. Refer to Rear Seat Back Cushion Removal and Installation (40%) 2. Remove Rear Seat Back Latch Release Handle Bezel. Refer to Rear Seat Back Latch Release Handle Bezel Replacement 3. Remove Rear Seat Head Restraint Guide. Refer to Rear Seat Head Restraint Guide Replacement 4. Remove Rear Seat Anchor Plate Bezel. Refer to Rear Seat Anchor Plate Bezel Replacement	
1	Rear Seat Back Cushion Cover Procedure 1. Remove the hog rings from the seat back pad. 2. Disconnect the J-channel from the seat back cushion frame. 3. Disconnect the electrical connector, if equipped with heated seat. 4. Remove the seat back cushion cover from the pad.
2	Rear Seat Support Refer to Rear Seat Support Replacement

Callout	Component Name
3	Rear Seat Back Cushion Pad

REAR SEAT BACK CUSHION COVER AND PAD REPLACEMENT (60%)

Fig. 28: Rear Seat Back Cushion Cover and Pad (60%)
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove Rear Seat Back Cushion. Refer to Rear Seat Back Cushion Removal and Installation (60%) 2. Remove Rear Seat Back Latch Release Handle Bezel. Refer to Rear Seat Back Latch Release Handle Bezel Replacement 3. Remove Rear Seat Belt Opening Cover. Refer to Rear Seat Belt Opening Cover Replacement 4. Remove Rear Seat Head Restraint Guide. Refer to Rear Seat Head Restraint Guide Replacement 5. Remove Rear Seat Armrest. Refer to Rear Seat Armrest Replacement 6. Remove Rear Seat Anchor Plate Bezel. Refer to Rear Seat Anchor Plate Bezel Replacement	
1	Rear Seat Back Cushion Cover Procedure

Callout	Component Name
	1. Disconnect the J-channel from the seat back cushion frame. 2. Disconnect the electrical connector, if equipped with heated seat. 3. Remove the seat back cushion cover from the pad.
2	Rear Seat Support Refer to Rear Seat Support Replacement
3	Rear Seat Back Cushion Pad

REAR SEAT BACK CUSHION FRAME REPLACEMENT

Fig. 29: Rear Seat Back Cushion Frame
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Rear Seat Back Cushion Cover and Pad. Refer to Rear Seat Back Cushion Cover and Pad Replacement (40%)Rear Seat Back Cushion Cover and Pad Replacement (60%)	
1	Rear Seat Back Cushion Frame Procedure Transfer components as necessary.

REAR SEAT BACK CUSHION HINGE REPLACEMENT

Fig. 30: Rear Seat Back Cushion Hinge

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove Rear Seat Back Cushion. Refer to Rear Seat Back Cushion Removal and Installation (60%)Rear Seat Back Cushion Removal and Installation (40%) 2. Remove Rear Compartment Floor Stowage Trim Compartment. Refer to Rear Compartment Floor Stowage Trim Compartment Replacement	
1	Rear Seat Back Cushion Hinge Fastener (Qty: 3) CAUTION: Refer to Fastener Caution . Tighten 45 N.m (33 lb ft)
2	Rear Seat Back Cushion Hinge Procedure Detach the rear seat back cushion hinge from the guide pin.

REAR SEAT SUPPORT REPLACEMENT

Fig. 31: Rear Seat Support

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the seat back cover. Refer to Rear Seat Back Cushion Cover and Pad Replacement (40%) Rear Seat Back Cushion Cover and Pad Replacement (60%)	
1	Rear Seat Support Procedure Release the rear seat anchor plate bezel using a suitable flat-bladed tool.

REAR SEAT BACK LATCH RELEASE HANDLE BEZEL REPLACEMENT

Fig. 32: Rear Seat Back Latch Release Handle Bezel

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear Seat Back Cushion Latch Release Handle Bezel Procedure Using a suitable flat-bladed tool, push inward on the rear tabs while pulling upward from the rear of the bezel to release it from the seat.

REAR SEAT ANCHOR PLATE BEZEL REPLACEMENT

Fig. 33: Rear Seat Anchor Plate Bezel

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear Seat Anchor Plate Bezel Procedure Release the rear seat anchor plate bezel using a suitable flat-bladed tool.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B191A OR B191B: FRONT/REAR HEATED SEAT MODULE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC B191A 39

Front Heated Seat Module

DTC B191B 39

Rear Heated Seat Module

Circuit/System Description

An internal fault is detected inside the control module. No external circuits are involved.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

The control module detects an internal fault.

Action Taken When the DTC Sets

The seat heating control module will disable all heated seat functions.

Conditions for Clearing the DTC

- The DTC clears when the diagnostic runs and passes.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Reference Information

Schematic Reference

Heated/Cooled Seat Schematics

Connector End View Reference

COMPONENT CONNECTOR END VIEWS - INDEX

Description and Operation

- [Heated Seats Description and Operation](#)
- [Rear Heated Seats Description and Operation](#)

Electrical Information Reference

- [Circuit Testing](#)
- [Connector Repairs](#)
- [Testing for Intermittent Conditions and Poor Connections](#)
- [Wiring Repairs](#)

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

DTC B191A

1. Ignition ON.
2. Verify DTC B191A is not set.
 - **If the DTC is set**

Replace the K29F Seat Heating Control Module - Front.

- **If the DTC is not set**

3. All OK.

DTC B191B

1. Ignition ON.
2. Verify DTC B191B is not set.

- **If the DTC is set**

Replace the K29R Seat Heating Control Module - Rear.

- **If the DTC is not set**

3. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Refer to [Control Module References](#) for K29F Seat Heating Control Module - Front or K29R Seat Heating Control Module - Rear replacement, programming and setup

SYMPTOMS - SEAT HEATING AND COOLING

IMPORTANT: The following steps must be completed before using the symptom tables.

1. Perform the [Diagnostic System Check - Vehicle](#) before using the symptom tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control module(s) can communicate via the serial data link.
2. Refer to the system description and operation from the following list in order to familiarize yourself with the system functions:
 - [Heated Seats Description and Operation](#)
 - [Rear Heated Seats Description and Operation](#)

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the power seats. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Inspect the seat adjuster track for conditions which may cause binding or objects within the seat adjustment range which obstruct movement or interfere with wiring.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for](#)

Intermittent Conditions and Poor Connections .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [Front Heated Seat Malfunction](#)
- [Rear Heated Seat Malfunction](#)

FRONT HEATED SEAT MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

1. Driver and passenger heated seats are inoperative. 2. Driver heated seat is inoperative 3. Driver seat back heat function is inoperative 4. Driver seat cushion heat function is inoperative 5. Degraded driver heated seat operation 6. Passenger heated seat is inoperative 7. Passenger seat back heat function is inoperative 8. Passenger seat cushion heat function is inoperative 9. Degraded passenger heated seat operation				

Circuit/System Description

The driver and passenger heated seat switches are located with the HVAC controls. When a heated seat switch is pressed, a LIN bus serial data message is sent from the HVAC controls to the HVAC control module. In turn the HVAC control module sends a low speed GMLAN serial data message to the body control module (BCM) indicating the heated seat command. The BCM serves as the heated seat system master to determine the requested operating mode. The BCM then sends a LIN bus serial data message to the seat heating control module indicating the heated seat command. In response to this message, the seat heating control module attempts to drive the appropriate seat heating elements per the BCM command.

The seat heating control module controls heated seat operation for the driver and passenger seats. When active, power is applied to the seat cushion and back heater elements through a common pulse width modulated (PWM) voltage supply control circuit. Each individual heater element is switched to ground by the module

through a common low side drive control circuit.

The seat back and cushion temperature sensors (thermistors) are packaged with the seat heating elements located just under the seat covers. The seat heating control module supplies each temperature sensor with a 5 V reference signal circuit and a low reference circuit. The module monitors the voltage from the signal circuit to determine the temperature of the seat.

The temperature sensor varies in resistance based on the temperature of the heating element causing the signal voltage to change. Once the module senses the seat reached the set temperature, it will then begin regulate the current flow through the heater elements in order to maintain the desired seat temperature based on the feedback voltage from the sensor.

Diagnostic Aids

- A short to ground or B+ in either the heating element voltage control circuit or ground control circuit will cause both the driver and front passenger heated seats to be inoperative.
- An open in either the voltage control circuit or ground control circuit between the module and the splice will cause the seat cushion and seat back the heated seat function to be inoperative for that seat.
- A short to ground on either the seat cushion or seat back temperature sensor signal circuit will cause the heated seat function to be inoperative for that seat.
- An open in either the voltage control circuit or ground control circuit between the splice and the heating element will cause just that one heating element to be inoperative.
- The following faults will cause a degraded heated seat operation for both the seat back and seat cushion.
 - An open or a short to voltage on either the seat cushion or seat back temperature sensor signal circuit.
 - An open in either the seat cushion or seat back temperature sensor low reference circuit.
 - A fault in either the seat cushion or seat back temperature sensor.
- A broken wire in a heating element may cause a degraded heated seat operation for that particular heating element.
- When inactive the seat heating control module connects the heating element low side outputs to a common reference point internal to the module which is biased to approximately 3.4 V. The module uses this biased voltage in order to check the high side and low side control circuits for a short to battery or ground before enabling the driver and passenger seat heating elements.
- With both the seat cushion and seat back heater elements disconnected, if the high side output of the module is measured it will display a low current bleed off voltage between 3.4 - 12 V. This bleed off voltage does not have a meaningful diagnostic purpose. With one or both of the heater elements connected you would just see the 3.4 V biased voltage from this circuit.
- If the heated seats are on high, the temperature level may automatically be lowered after approximately 30 min of operation.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Vehicle ON.

NOTE: Review the Diagnostic Fault Information table and Diagnostic Aids in order to get a better understanding of the possible heated seat system faults before proceeding Circuit/System Verification and Circuit/System Testing.

2. Verify the scan tool Body Control Module Driver Seat Heating/Venting/Cooling Mode parameter changes between OFF and Seat Back and Cushion Heating when pressing the driver heated seat switch.

- **If the parameter does not change**

Replace the A26 HVAC Controls.

- **If the parameter changes**

3. Verify the scan tool Passenger Seat Heating/Venting/Cooling Mode parameter changes between OFF and Seat Back and Cushion Heating when pressing the passenger heated seat switch.

- **If the parameter does not change**

Replace the A26 HVAC Controls.

- **If the parameter changes**

4. Verify the driver and front passenger heated seats operate.

- **If the driver and front passenger heated seats are inoperative**

Refer to Circuit/System Testing - Both Heated Seats are Inoperative

- **If the seat cushion and back heating elements are inoperative of one seat**

Refer to Circuit/System Testing - One Heated Seat is Inoperative

- **If just one of the heating elements is inoperative**

Refer to Circuit/System Testing - One Heating Element is Inoperative.

- **If the driver seat exhibits a degraded heated seat operation**

Refer to Circuit/System Testing - Degraded Heated Seat Operation Driver Seat

- **If the passenger seat exhibits a degraded heated seat operation**

Refer to Circuit/System Testing - Degraded Heated Seat Operation Passenger Seat

- **If both heated seats operate**

5. All OK.

Circuit/System Testing

Both Heated Seats are Inoperative

NOTE: Circuit/System Verification must be performed before proceeding with Circuit/System Testing.

1. Vehicle OFF, disconnect the X1 harness connector at the K29F Seat Heating Control Module - Front, Vehicle ON.

2. Verify a test lamp illuminates between each B+ circuit terminal listed below and ground.

- Terminal 7

- Terminal 10

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Vehicle OFF, remove the test lamp.

2. Test for less than 2 Ω in the B+ circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω , verify the fuse is OK and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Vehicle OFF, remove the test lamp.

2. Test for infinite resistance between the B+ circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance, replace the K29F Seat Heating Control Module - Front.

- **If the test lamp illuminates**

3. Vehicle OFF.

4. Test for infinite resistance between each control circuit terminal listed below and ground, one at a time.

- Terminal 2

- Terminal 6

- **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

5. Vehicle ON.
6. Test for less than 1 V between each control circuit terminal listed below and ground, one at a time.
 - Terminal 2
 - Terminal 6
 - **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**
7. Replace the K29F Seat Heating Control Module - Front.

One Heated Seat is Inoperative

NOTE: **Circuit/System Verification must be performed before proceeding with Circuit/System Testing**

1. Vehicle OFF, disconnect the X1 harness connector at the K29F Seat Heating Control Module - Front, Vehicle ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 7 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Vehicle OFF, remove the test lamp
 2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is OK and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Vehicle OFF, remove the test lamp.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K29F Seat Heating Control Module - Front.
 - **If the test lamp illuminates**
3. Vehicle OFF, connect the X1 harness connector at the K29F Seat Heating Control Module - Front. Disconnect the harness connector at the E14 Seat Heating Element - Cushion and the E14 Seat Heating Element - Back, Vehicle ON.

NOTE: **When performing this test ensure that you are testing from the correct terminal. Testing from the incorrect terminal will cause a misdiagnosis of the circuit. Three of the four terminals in this connector will not only display a voltage reading but a different voltage reading.**

4. Test for 4.8 - 5.2 V between each signal circuit terminal listed below and ground, one at a time.
 - E14 Seat Heating Element - Cushion terminal 2
 - E14 Seat Heating Element - Back terminal 2
 - **If less than 4.8 V**

1. Vehicle OFF, disconnect the X2 harness connector at the K29F Seat Heating Control Module - Front.
2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K29F Seat Heating Control Module - Front.

• **If greater than 5.2 V**

1. Vehicle OFF, disconnect the X2 harness connector at the K29F Seat Heating Control Module - Front, Vehicle ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K29F Seat Heating Control Module - Front.
- **If between 4.8 - 5.2 V**
5. Connect a test lamp between control circuit terminal 1 and control circuit terminal 4 of the E14 Seat Heating Element - Back, Vehicle ON.

NOTE: **The test lamp should turn ON for approximately 10 s after the heated seat is commanded ON.**

6. Verify the test lamp turns ON after pressing the heated seat switch.
 - **If the test lamp is always OFF**
1. Vehicle OFF, remove the test lamp, disconnect the X1 harness connector at the K29F Seat Heating Control Module - Front.
2. Test for less than 2 Ω in each control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K29F Seat Heating Control Module - Front.
- **If the test lamp turns ON**
7. Vehicle OFF, connect the harness connector at the E14 Seat Heating Element - Cushion, Vehicle ON.
8. Verify the test lamp turns ON after pressing the heated seat switch.
 - **If the test lamp is always OFF**

NOTE: **Because of the type of material used in the heater element, a reliable resistance value is unavailable for a component test.**

Test or replace the E14 Seat Heating Element - Cushion.

- **If the test lamp turns ON**

NOTE: **Because of the type of material used in the heater element, a reliable resistance value is unavailable for a component test.**

9. Test or replace the E14 Seat Heating Element - Back.

One Heating Element is Inoperative

NOTE: **Circuit/System Verification must be performed before proceeding with Circuit/System Testing.**

1. Vehicle OFF, disconnect the harness connector at the appropriate E14 Seat Heating Element.
2. Connect a test lamp between control circuit terminal 1 and control circuit terminal 4, Vehicle ON.
3. Verify the test lamp turns ON after pressing the heated seat switch.
 - **If the test lamp is always OFF**
 1. Vehicle OFF, remove the test lamp, disconnect the X1 harness connector at the K29F Seat Heating Control Module - Front.
 2. Test for less than 2 Ω in each control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - **If the test lamp turns ON**

NOTE: **Because of the type of material used in the heater element, a reliable resistance value is unavailable for a component test.**

4. Test or replace the E14 Seat Heating Element.

Degraded Heated Seat Operation Driver Seat

NOTE: **Circuit/System Verification must be performed before proceeding with Circuit/System Testing**

1. Vehicle OFF, disconnect the harness connector at each component listed below. It may take up to 2 min for all vehicle systems to power down.
 - E14B Seat Heating Element - Driver Cushion
 - E14A Seat Heating Element - Driver Back
2. Test for less than 40 Ω between each low reference circuit terminal listed below and ground, one at a time.
 - E14B Seat Heating Element - Driver Cushion terminal 3
 - E14A Seat Heating Element - Driver Back terminal 3
 - **If 40 Ω or greater**
 1. Vehicle OFF, disconnect the X2 harness connector at the K29F Seat Heating Control Module - Front.
 2. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K29F Seat Heating Control Module - Front.
 - **If less than 40 Ω**
3. Vehicle ON.

4. Test for 4.8 - 5.2 V between each signal circuit terminal listed below and ground, one at a time.
 - E14B Seat Heating Element - Driver Cushion terminal 2
 - E14A Seat Heating Element - Driver Back terminal 2
 - **If less than 4.8 V**
 1. Vehicle OFF, disconnect the X2 harness connector at the K29F Seat Heating Control Module - Front.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K29F Seat Heating Control Module - Front.
 - **If greater than 5.2 V**
 1. Vehicle OFF, disconnect the X2 harness connector at the K29F Seat Heating Control Module - Front, Vehicle ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K29F Seat Heating Control Module - Front.
 - **If between 4.8 - 5.2 V**
5. Vehicle OFF, connect the harness connector at the E14B Seat Heating Element - Driver Cushion and the E14A Seat Heating Element - Driver Back. Disconnect the X2 harness connector at the K29F Seat Heating Control Module - Front.
6. Test for 500 Ω - 300 k Ω between the signal circuit and the low reference circuit terminals listed below, one at a time.
 - E14B Seat Heating Element - Driver Cushion terminal 6 and terminal 1
 - E14A Seat Heating Element - Driver Back terminal 3 and terminal 1
 - **If not between 500 Ω - 300 k Ω**

Replace the E14 Seat Heating Element.
 - **If between 500 Ω - 300 k Ω**
7. Replace the K29F Seat Heating Control Module - Front.

Degraded Heated Seat Operation Passenger Seat

NOTE: **Circuit/System Verification must be performed before proceeding with Circuit/System Testing**

1. Vehicle OFF, disconnect the harness connector at each component listed below. It may take up to 2 min for all vehicle systems to power down.
 - E14D Seat Heating Element - Passenger Cushion
 - E14C Seat Heating Element - Passenger Back

2. Test for less than 40 Ω between each low reference circuit terminal listed below and ground, one at a time.
 - E14D Seat Heating Element - Passenger Cushion terminal 3
 - E14C Seat Heating Element - Passenger Back terminal 3
 - **If 40 Ω or greater**
 1. Vehicle OFF, disconnect the X2 harness connector at the K29F Seat Heating Control Module - Front.
 2. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K29F Seat Heating Control Module - Front.
 - **If less than 40 Ω**
3. Vehicle ON.
4. Test for 4.8 - 5.2 V between each signal circuit terminal listed below and ground, one at a time.
 - E14D Seat Heating Element - Passenger Cushion terminal 2
 - E14C Seat Heating Element - Passenger Back terminal 2
 - **If less than 4.8 V**
 1. Vehicle OFF, disconnect the X2 harness connector at the K29F Seat Heating Control Module - Front.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K29F Seat Heating Control Module - Front.
 - **If greater than 5.2 V**
 1. Vehicle OFF, disconnect the X2 harness connector at the K29F Seat Heating Control Module - Front, Vehicle ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K29F Seat Heating Control Module - Front.
 - **If between 4.8 - 5.2 V**
 - 5. Vehicle OFF, connect the harness connector at the E14D Seat Heating Element - Passenger Cushion and the E14C Seat Heating Element - Passenger Back. Disconnect the X2 harness connector at the K29F Seat Heating Control Module - Front.
 - 6. Test for 500 Ω - 300 k Ω between the signal circuit and the low reference circuit terminals listed below, one at a time.
 - E14D Seat Heating Element - Passenger Cushion terminal 5 and terminal 2
 - E14C Seat Heating Element - Passenger Back terminal 4 and terminal 12
 - **If not between 500 Ω - 300 k Ω**

Replace the E14 Seat Heating Element.

- **If between 500 Ω - 300 k Ω**

7. Replace the K29F Seat Heating Control Module - Front.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Heater and Air Conditioning User Interface Control Replacement](#)
- Refer to [Driver or Passenger Seat Back Heater Replacement](#)
- Refer to [Front Seat Cushion Heater Replacement](#)
- Refer to [Control Module References](#) for K29F Seat Heating Control Module - Front replacement, programming and setup

REAR HEATED SEAT MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Degraded right rear heated seat operation 6. Rear heated seat switch indicator malfunction 7. The heated seat is always ON 8. No effect				

Circuit/System Description

When a heated seat switch is pressed, the heated seat switch signal circuit from the body control module (BCM) is pulled low indicating the heated seat command. The BCM serves as the heated seat system master to determine the requested operating mode. The BCM then sends a LIN bus serial data message to the rear seat heating control module indicating the heated seat command. In response to this message, the seat heating control module attempts to drive the appropriate seat heating element per the BCM command.

The rear seat heating control module controls heated seat operation for the left and right rear seats. When active, power is applied to the seat cushion heater element through a pulse width modulated (PWM) voltage supply control circuit. The heater element is switched to ground by the module through a low side drive control circuit.

The seat cushion temperature sensor (thermistor) is packaged with the seat heating element located just under the seat cover. The rear seat heating control module supplies the temperature sensor with a 5 V reference signal circuit and a low reference circuit. The module monitors the voltage from the signal circuit to determine the temperature of the seat.

The temperature sensor varies in resistance based on the temperature of the heating element causing the signal voltage to change. Once the module senses the seat reached the set temperature, it will then begin regulate the current flow through the heater elements in order to maintain the desired seat temperature based on the feedback voltage from the sensor.

Diagnostic Aids

- A short to ground or B+ in either the heating element voltage control circuit or ground control circuit will cause both rear heated seats to be inoperative.
- A short to ground on the seat cushion temperature sensor signal circuit will cause the heated seat function to be inoperative for that seat.
- The following faults will cause a degraded heated seat operation.
 - An open or a short to voltage on the seat cushion temperature sensor signal circuit.
 - An open in the seat cushion temperature sensor low reference circuit.
 - A fault in the seat cushion temperature sensor.
- A broken wire in a heating element may cause a degraded heated seat operation for that particular heating element.
- When inactive the seat heating control module connects the heating element low side outputs to a common reference point internal to the module which is biased to approximately 3.5 V. The module uses this biased voltage in order to check the high side and low side control circuits for a short to battery or ground before enabling the left and right rear seat heating elements.
- With the seat cushion heater element disconnected, if the high side output of the control module is measured it will display a low current 12 V bleed off voltage. This bleed off voltage does not have a meaningful diagnostic purpose. With the heater elements connected you would just see the 3.5 V biased voltage from this circuit.
- If the heated seats are on high, the temperature level may automatically be lowered after approximately 30 min of operation.

[Control Module References](#) for scan tool information

[Circuit/System Verification](#)

1. Vehicle ON.

NOTE: Review the Diagnostic Fault Information table and Diagnostic Aids in order to get a better understanding of the possible heated seat system faults before proceeding Circuit/System Verification and Circuit/System Testing.

2. Verify the scan tool Body Control Module Left Rear Seat Heating/Venting/Cooling Mode parameter changes between Off and Seat Back and Cushion Heating when pressing the left rear heated seat switch.

- **If the parameter does not change**

Refer to Circuit/System Testing - Heated Seat Switch Circuit Test.

- **If the parameter changes**

3. Verify the scan tool Right Rear Seat Heating/Venting/Cooling Mode parameter changes between Off and Seat Back and Cushion Heating when pressing the right rear heated seat switch.

- **If the parameter does not change**

Refer to Circuit/System Testing - Rear Heated Seat Switch Circuit Test.

- **If the parameter changes**

4. Verify the left and right rear heated seats operate.

- **If both rear heated seats are inoperative**

Refer to Circuit/System Testing - Both Rear Heated Seats are Inoperative

- **If just one of the rear heated seats is inoperative**

Refer to Circuit/System Testing - One Rear Heated Seat is Inoperative

- **If the left rear seat exhibits a degraded heated seat operation**

Refer to Circuit/System Testing - Degraded Heated Seat Operation Left Rear Seat

- **If the right rear seat exhibits a degraded heated seat operation**

Refer to Circuit/System Testing - Degraded Heated Seat Operation Right Rear Seat

- **If both heated seats operate**

5. Verify the rear heated seat switch indicator illuminates after pressing the rear seat heating switch.

- **If the indicator does not illuminate**

Refer to Circuit/System Testing - Heated Seat Switch Indicator Circuit Test.

- **If the indicator illuminates**

6. All OK.

Circuit/System Testing

Rear Heated Seat Switch Circuit Test

NOTE: Circuit/System Verification must be performed before proceeding with Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the appropriate S32 Seat Heating Switch - Rear. It may take up to 2 min for all vehicle system to power down.
2. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
 - **If 10 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
3. Vehicle ON.
4. Verify the appropriate scan tool Rear Seat Heating/Venting/Cooling Mode parameter is Off.
 - **If not Off**
 1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal 3 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If Off**
5. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the ground circuit terminal 1.
6. Verify the scan tool scan tool Rear Seat Heating/Venting/Cooling Mode parameter is Seat Back and Cushion Heating - High.
 - **If not Seat Back and Cushion Heating - High**
 1. Vehicle OFF, remove the jumper wire, disconnect the X4 harness connector at the K9 Body Control Module, Vehicle ON.
 2. Test for less than 1 V between the signal circuit terminal 3 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If Seat Back and Cushion Heating - High**
7. Test or replace the S32 Seat Heating Switch - Rear.

Both Heated Seats are Inoperative

NOTE: Circuit/System Verification must be performed before proceeding with Circuit/System Testing.

1. Vehicle OFF and all vehicle systems OFF, disconnect the X1 harness connector at the K29R Seat Heating

Control Module - Rear, Vehicle ON.

2. Verify a test lamp illuminates between each B+ circuit terminal listed below and ground.
 - Terminal 7
 - Terminal 10
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Vehicle OFF, remove the test lamp.
 2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is OK and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Vehicle OFF, remove the test lamp.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K29R Seat Heating Control Module - Rear.
 - **If the test lamp illuminates**
3. Vehicle OFF.
4. Test for infinite resistance between each control circuit terminal listed below and ground, one at a time.
 - Terminal 2
 - Terminal 6
 - **If less than infinite resistance**

Repair the short to ground on the circuit.
 - **If infinite resistance**
5. Vehicle ON.
6. Test for less than 1 V between each control circuit terminal listed below and ground, one at a time.
 - Terminal 2
 - Terminal 6
 - **If 1 V or greater**

Repair the short to voltage on the circuit.
 - **If less than 1 V**
7. Replace the K29R Seat Heating Control Module - Rear.

One Heated Seat is Inoperative

NOTE: **Circuit/System Verification must be performed before proceeding with Circuit/System Testing**

1. Vehicle OFF, disconnect the X1 harness connector at the K29R Seat Heating Control Module - Rear, Vehicle ON.

2. Verify a test lamp illuminates between the B+ circuit terminal 7 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Vehicle OFF, remove the test lamp
 2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is OK and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Vehicle OFF, remove the test lamp.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K29R Seat Heating Control Module - Rear.
 - **If the test lamp illuminates**
3. Vehicle OFF, connect the X1 harness connector at the K29R Seat Heating Control Module - Rear and disconnect the harness connector at the appropriate E14 Seat Heating Element - Rear Cushion, Vehicle ON.

NOTE: When performing this test ensure that you are testing from the correct terminal. Testing from the incorrect terminal will cause a misdiagnosis of the circuit. Three of the four terminals in this connector will not only display a voltage reading but a different voltage reading.

4. Test for 4.8 - 5.2 V between the signal circuit terminal 2 and ground.
 - **If less than 4.8 V**
 1. Vehicle OFF, disconnect the X2 harness connector at the K29R Seat Heating Control Module - Rear.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K29R Seat Heating Control Module - Rear.
 - **If greater than 5.2 V**
 1. Vehicle OFF, disconnect the X2 harness connector at the K29R Seat Heating Control Module - Rear, Vehicle ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K29R Seat Heating Control Module - Rear.
 - **If between 4.8 - 5.2 V**
5. Connect a test lamp between control circuit terminal 1 and control circuit terminal 4, Vehicle ON.

NOTE: The test lamp should turn ON for approximately 20 s after the heated seat

is commanded ON.

6. Verify the test lamp turns ON after pressing the rear heated seat switch.

- **If the test lamp is always OFF**

1. Vehicle OFF, remove the test lamp, disconnect the X1 harness connector at the K29R Seat Heating Control Module - Rear.

2. Test for less than 2 Ω in each control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K29R Seat Heating Control Module - Rear.

- **If the test lamp turns ON**

NOTE: Because of the type of material used in the heater element, a reliable resistance value is unavailable for a component test.

7. Test or replace the E14 Seat Heating Element - Rear Cushion.

Degraded Heated Seat Operation Left Rear Seat

NOTE: Circuit/System Verification must be performed before proceeding with Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the E14F Seat Heating Element - Left Rear Cushion. It may take up to 2 min for all vehicle systems to power down.

2. Test for less than 40 Ω between the low reference circuit terminal 3 and ground.

- **If 40 Ω or greater**

1. Vehicle OFF, disconnect the X2 harness connector at the K29R Seat Heating Control Module - Rear.

2. Test for less than 2 Ω in the low reference circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K29R Seat Heating Control Module - Rear.

- **If less than 40 Ω**

3. Vehicle ON.

4. Test for 4.8 - 5.2 V between the signal circuit terminal 2 and ground.

- **If less than 4.8 V**

1. Vehicle OFF, disconnect the X2 harness connector at the K29R Seat Heating Control Module - Rear.

2. Test for infinite resistance between the signal circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K29R Seat Heating Control Module - Rear.

- **If greater than 5.2 V**

1. Vehicle OFF, disconnect the X2 harness connector at the K29R Seat Heating Control Module - Rear, Vehicle ON.
2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K29R Seat Heating Control Module - Rear.

- **If between 4.8 - 5.2 V**

5. Vehicle OFF, connect the harness connector at the E14F Seat Heating Element - Left Rear Cushion and disconnect the X2 harness connector at the K29R Seat Heating Control Module - Rear.
6. Test for 500 Ω - 300 k Ω between the signal circuit terminal 6 and the low reference circuit terminal 1.

- **If not between 500 Ω - 300 k Ω**

Replace the E14F Seat Heating Element - Left Rear Cushion.

- **If between 500 Ω - 300 k Ω**

7. Replace the K29R Seat Heating Control Module - Rear.

Degraded Heated Seat Operation Right Rear Seat

NOTE: **Circuit/System Verification must be performed before proceeding with Circuit/System Testing**

1. Vehicle OFF, disconnect the harness connector at the E14H Seat Heating Element - Right Rear Cushion. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 40 Ω between the low reference circuit terminal 3 and ground.
 - **If 40 Ω or greater**
 1. Vehicle OFF, disconnect the X2 harness connector at the K29R Seat Heating Control Module - Rear.
 2. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K29R Seat Heating Control Module - Rear.
 - **If less than 40 Ω**
3. Vehicle ON.
4. Test for 4.8 - 5.2 V between the signal circuit terminal 2 and ground.
 - **If less than 4.8 V**
 1. Vehicle OFF, disconnect the X2 harness connector at the K29R Seat Heating Control Module - Rear.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω , replace the K29R Seat Heating Control Module - Rear.
- **If greater than 5.2 V**
 1. Vehicle OFF, disconnect the X2 harness connector at the K29R Seat Heating Control Module - Rear, Vehicle ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K29R Seat Heating Control Module - Rear.
- **If between 4.8 - 5.2 V**
 5. Vehicle OFF, connect the harness connector at the E14H Seat Heating Element - Right Rear Cushion and disconnect the X2 harness connector at the K29R Seat Heating Control Module - Rear.
 6. Test for 500 Ω - 300 k Ω between the signal circuit terminal 5 and the low reference circuit terminal 2.
 - **If not between 500 Ω - 300 k Ω**

Replace the E14H Seat Heating Element - Right Rear Cushion.
 - **If between 500 Ω - 300 k Ω**
 7. Replace the K29R Seat Heating Control Module - Rear.

Heated Seat Switch Indicator Circuit Test

NOTE: **Circuit/System Verification must be performed before proceeding with Circuit/System Testing.**

1. Vehicle OFF, disconnect the harness connector at the appropriate S32 Seat Heating Switch - Rear, Vehicle ON.

NOTE: **The test lamp in the following step will illuminate at LOW intensity. This is normal circuit operation and does not indicate a circuit malfunction.**

2. Verify a test lamp illuminates at LOW intensity between the control circuit terminal 6 and ground.
 - **If the test lamp does not illuminate**
 1. Vehicle OFF, remove the test lamp, disconnect the X1 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module
 - **If the test lamp illuminates at FULL intensity**
 1. Vehicle OFF, remove the test lamp, disconnect the X1 harness connector at the K9 Body Control Module, Vehicle ON.
 2. Test for less than 1 V between the control circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp illuminates at LOW intensity**
3. Connect a test lamp illuminate between control circuit terminal 6 and control circuit terminal 4.
 4. Verify the test lamp Does Not illuminate.
 - **If the test lamp illuminates**
 1. Vehicle OFF, remove the test lamp, disconnect the X5 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit terminal 4 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If the test lamp does not illuminate**
 5. Verify the test lamp illuminates when commanding the Rear Seat Heating Indicator Active with a scan tool.
 - **If the test lamp does not illuminate**
 1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, Vehicle ON.
 2. Test for less than 1 V between the control circuit terminal 4 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If the test lamp illuminates**
 6. Test or replace the S32 Seat Heating Switch - Rear.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Rear Seat Heater Switch Replacement](#)
- Refer to [Rear Seat Cushion Heater Replacement](#)
- Refer to [Control Module References](#) for K29R Seat Heating Control Module - Rear replacement, programming and setup

REPAIR INSTRUCTIONS

WIRE TO WIRE REPAIR - SEATS

Special Tools

- **EL-38125-10** Splice Sleeve Crimping Tool (non GMNA)
- **J-38125-5A** Ultra Torch Special Tool
- **J-38125-8** Splice Sleeve Crimping Tool (GMNA)

For equivalent regional tools, refer to [Special Tools](#).

WARNING: In order to reduce the risk of personal injury, loss of high voltage isolation to ground and higher system impedance, do not attempt to repair any HV wiring, connector, or terminal that is damaged. High voltage coaxial type cables are not repairable. Never attempt to repair a coaxial type cable. The entire cable/harness or component must be replaced. In order to maintain system integrity and personal safety, never attempt to repair any high voltage wiring, cables, or terminals. Performing this procedure on high voltage circuits may result in serious injury or death.

NOTE: If the wiring harness internal to the transmission is damaged, the wiring harness must be replaced. The use of splice sleeves in an attempt to repair the internal transmission wires, connectors, or terminals could result in performance issues.

NOTE: Do not splice wires in Door Harness Grommets.

NOTE: The DuraSeal splice sleeves have the following 2 critical features:

- A special heat shrink sleeve environmentally seals the splice. The heat shrink sleeve contains a sealing adhesive inside.
- A cross hatched (knurled) core crimp provides the necessary low resistance contact integrity for these sensitive, low energy circuits.

Use only DuraSeal splice sleeves to form a one-to-one splice on all types of insulation except high voltage and specialty cables. Use DuraSeal splice sleeves where there are special requirements such as moisture sealing. Follow the instructions below in order to splice copper wire using DuraSeal splice sleeves.

Splice Sleeve Selection

Splice Sleeve Color	Crimp Tool Nest Color		Wire Gauge mm ² / (AWG)
	3 Crimp Nests	4 Crimp Nests	
Salmon (Yellow-Pink) 19300089	Red (1) or Red/Green (1)	Red (2)	0.22 - 0.8/(18 - 26)
Blue 19168447	Blue (2)	Blue (3)	1.0 - 2.0/(14 - 16)
Yellow 19168448	Yellow (3)	Yellow (4)	3.0 - 5.0/(10 - 12)

NOTE: You must perform the following procedures in the listed order. Repeat the procedure if any wire strands are damaged. You must obtain a clean strip with all of the wire strands intact.

1. Open the harness by removing any tape:

- Use a sewing seam ripper, available from sewing supply stores, in order to cut open the harness in order to avoid wire insulation damage.

- Use the DuraSeal splice sleeves on all types of insulation except Tefzel and coaxial.
- Do not use the crimp and DuraSeal splice sleeve to form a splice with more than 2 wires coming together.

2. Cut as little wire off the harness as possible. You may need the extra length of wire in order to change the location of a splice.

Adjust splice locations so that each splice is at least 40 mm (1.5 in) away from the other splices, harness branches, or connectors.

3. Strip the insulation:

- When adding a length of wire to the existing harness, use the same size wire as the original wire.
- Perform one of the following items in order to find the correct wire size:
 - Find the wire on the schematic and convert to regional wiring gauge size.
 - If you are unsure of the wire size, begin with the largest opening in the wire stripper and work down until achieving a clean strip of the insulation.
- Strip approximately 5.0 mm (0.20 in) of insulation from each wire to be spliced.
- Do not nick or cut any of the strands. Inspect the stripped wire for nicks or cut strands.
- If the wire is damaged, repeat this procedure after removing the damaged section.

4. For high temperature wiring, slide a section of high temperature SCT1 shrink tubing down the length of wire to be spliced. Ensure that the shrink tubing will not interfere with the splice procedure.

5. Select the proper DuraSeal splice sleeve according to the wire size. Refer to the above table at the beginning of the repair procedure for the color coding of the DuraSeal splice sleeves and the crimp tool nests.

Fig. 3: Splice Sleeve Crimping Tool With 4 Crimp Nests

Courtesy of GENERAL MOTORS COMPANY

6. The **EL-38125-10** splice sleeve crimping tool has four crimp nests. The largest crimp nest (4) is used for crimping 10 and 12 gauge wires. The second largest crimp nest (3) is used for crimping 14 and 16 gauge wires. The third largest crimp nest (2) is used for crimping 18 and 20 gauge wires. The smallest crimp nest (1) is used for crimping 22 to 26 gauge wires. The crimp nests are referenced in the table (farther above) under the crimp tool nest color.

Fig. 4: Splice Sleeve Crimping Tool With 3 Crimp Nests

Courtesy of GENERAL MOTORS COMPANY

7. The **J-38125-8** splice sleeve crimping tool has three crimp nests. The largest crimp nest (3) is used for crimping 10 and 12 gauge wires. The second largest crimp nest (2) is used for crimping 14 and 16 gauge wires. The smallest crimp nest (1) is used for crimping 18 to 20 gauge wires. The crimp nests are referenced in the table (farther above) under the crimp tool nest color.
8. Use the splice sleeve crimp tool in order to position the DuraSeal splice sleeve in the proper color nest of the splice sleeve crimp tool. For the four crimp nest tool, use the three largest crimp nests to crimp the splice sleeves. For the three crimp nest tool, use all three crimp nests to crimp the splice sleeves. Use the four and three crimp tool diagrams (above) and the table (farther above) to match the splice sleeve with the correct crimp nest. The crimp tool diagram callout numbers match the numbers in the table (under crimp tool nest color).

Fig. 5: Identifying DuraSeal Splice Sleeve

Courtesy of GENERAL MOTORS COMPANY

9. Place the DuraSeal splice sleeve in the nest. Ensure that the crimp falls midway between the end of the barrel and the stop. The sleeve has a stop (3) in the middle of the barrel (2) in order to prevent the wire (1) from going further. Close the hand crimper handles slightly in order to firmly hold the DuraSeal splice sleeve in the proper nest.

Fig. 6: Crimped DuraSeal Splice Sleeve

Courtesy of GENERAL MOTORS COMPANY

10. Insert the wire into the splice sleeve barrel until the wire hits the barrel stop. Refer to **Folded-Over Wire Repair** for splicing wires of 0.35 mm or less (22, 24, 26 gauge sizes) and for splicing wires of different gauges.
11. Tightly close the handles of the crimp tool until the crimper handles open when released.

The crimper handles will not open until you apply the proper amount of pressure to the DuraSeal splice sleeve. Repeat steps 4 and 6 for the opposite end of the splice.

Fig. 7: Heated Splice Sleeve

Courtesy of GENERAL MOTORS COMPANY

12. Using the heat torch, apply heat to the crimped area of the barrel.
13. Start in the middle and gradually move the heat barrel to the open ends of the tubing:
 - The tubing will shrink completely as the heat is moved along the insulation.
 - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.

Weatherpack™ Wiring Repair

NOTE: Some replacement pigtail connectors may be delivered without the terminated leads installed into the connector. For Weatherpack™ connectors, all terminated leads included in the package should to be installed into the connector. If the connector end view shows that a terminal is not occupied, the extra terminated lead(s) need to be installed and the end(s) sealed using a DuraSeal splice sleeve and taped back into the harness.

1. Insert the wire into the splice sleeve barrel until the wire hits the barrel stop. Refer to [Folded-Over Wire Repair](#) for splicing wires of 0.35 mm or less (22, 24, 26 gauge sizes) and for splicing wires of different gauges.

Fig. 8: Tightly Close Handles Of Crimp Tool

Courtesy of GENERAL MOTORS COMPANY

2. Tightly close the handles of the crimp tool until the crimper handles open when released.

The crimper handles will not open until you apply the proper amount of pressure to the DuraSeal splice sleeve. Holding the DuraSeal with one hand gently tug on the wire to ensure it is crimped in the DuraSeal.

3. Using the heat torch, apply heat to the crimped area of the barrel.

Fig. 9: Heat To Crimped Area Of Barrel

Courtesy of GENERAL MOTORS COMPANY

4. Start in the middle and gradually move the heat barrel to the open ends of the tubing:
 - The tubing will shrink completely as the heat is moved along the insulation.
 - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.

Fig. 10: Taping Extra Terminated Leads Back Into Harness

Courtesy of GENERAL MOTORS COMPANY

5. Tape the extra terminated lead(s) back into the harness.

High Temperature Wiring Repairs

Use the following procedures to perform high temperature wiring repairs:

1. Center the high temperature SCT1 shrink tube over the DuraSeal splice sleeve.
2. Using the heat torch, apply heat to the high temperature heat shrink tubing.
3. Gradually move the heat from the center to the open end of the tubing:
 - The tubing will shrink completely as the heat is moved along the insulation.
 - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.
4. Replace any reflective tape and clips that may have been removed during the repair.

CONNECTOR RECONNECTION - SEATS

Special Tools

EL-35616 Terminal Test Probe Kit

For equivalent regional tools, refer to [Special Tools](#).

When the condition is not currently present, but is indicated in DTC history, the cause may be intermittent. An intermittent may also be the cause when there is a customer complaint, but the symptom cannot be duplicated. Refer to the Symptom Table of the system that is suspect of causing the condition before trying to locate an intermittent condition.

Most intermittent conditions are caused by faulty electrical connections or wiring. Inspect for the following items:

- Loose, corroded, or painted terminal stud/fastener
- Wiring broken inside the insulation
- Poor connection between the male and female terminal at a connector
- A terminal not seated all the way into the connector body
- Poor terminal to wire connection - Some conditions which fall under this description are poor crimps, poor solder joints, crimping over the wire insulation rather than the wire itself, and corrosion in the wire to terminal contact area, etc.
- Pierced or damaged insulation can allow moisture to enter the wiring causing corrosion. The conductor can corrode inside the insulation, with little visible evidence. Look for swollen and stiff sections of wire in the suspect circuits.
- Wiring which has been pinched, cut, or its insulation rubbed through may cause an intermittent open or short as the bare area touches other wiring or parts of the vehicle.
- Wiring that comes in contact with hot or exhaust components
- Refer to [Inducing Intermittent Fault Conditions](#) in order to duplicate the conditions required, in order to verify the customer concern.
- Refer to [Testing for Electrical Intermittents](#) for test procedures to detect intermittent open, high resistance, short to ground, and short to voltage conditions.
- Refer to [Scan Tool Snapshot Procedure](#) for advanced intermittent diagnosis and Vehicle Data Recorder operation.

Testing for Terminal Fretting

Some intermittent conditions can be caused by wire terminal fretting corrosion. Fretting corrosion is a build-up of insulating, oxidized wear debris that can form when there is a small motion between electrical contacts. The oxidized wear debris can pile up enough at the electrical contact spots that the electrical resistance across the connection increases. Movement between the contacting surfaces as small as 10 to 100 microns can cause fretting. To put this in perspective, a sheet of paper is about 100 microns thick, so fretting motion is small and hard to see. Vibration and thermal expansion/contraction are the main sources that create fretting motion. Since vehicles vibrate and can experience large temperature swings, they are a good source for fretting motion. Tin, copper, nickel, and iron surfaces are all susceptible to fretting corrosion. Fretting corrosion can be difficult to see but it looks like small, dark smudges on the terminals contact surface.

To correct a fretting condition disconnect the suspect connector and add dielectric grease/lubricant (Nyogel

760G or equivalent, meeting GM specification 9986087) to both sides of the connector terminals. Then reconnect the connector and wipe away any excess lubricant. This will correct the additional terminal contact resistance due to the terminal fretting corrosion.

Testing for Proper Terminal Contact

It is important to test terminal contact at the component and any inline connectors before replacing a suspect component. Mating terminals must be inspected to ensure good terminal contact. A poor connection between the male and female terminal at a connector may be the result of contamination or deformation.

Contamination may be caused by the connector halves being improperly connected. A missing or damaged connector seal, damage to the connector itself, or exposing the terminals to moisture and dirt can also cause contamination. Contamination, usually in the underhood or underbody connectors, leads to terminal corrosion, causing an open circuit or intermittently open circuit.

Deformation is caused by probing the mating side of a connector terminal without the proper adapter. Always use the **EL-35616** kit when probing connectors. Other causes of terminal deformation are improperly joining the connector halves, or repeatedly separating and joining the connector halves. Deformation, usually to the female terminal contact tang, can result in poor terminal contact causing an open or intermittently open circuit.

Testing for Proper Terminal Contact in Bussed Electrical Centers

It is very important to use the correct test adapter when testing for proper terminal contact of fuses and relays in a bussed electrical center. Use the **EL-35616** kit to test for proper terminal contact. Failure to use the **EL-35616** kit can result in improper diagnosis of the bussed electrical center.

Follow the procedure below in order to test terminal contact:

1. Separate the connector halves.
2. Visually inspect the connector halves for contamination. Contamination may result in a white or green build-up within the connector body or between terminals. This causes high terminal resistance, intermittent contact, or an open circuit. An underhood or underbody connector that shows signs of contamination should be replaced in its entirety: terminals, seals, and connector body.
3. Using an equivalent male terminal/terminated lead, verify that the retention force is significantly different between a known good terminal and the suspect terminal. Replace the female terminal in question.

Flat Wire Connectors

There are no serviceable parts for flat wire connectors on the harness side or the component side.

Follow the procedure below in order to test terminal contact:

1. Remove the component in question.
2. Visually inspect each side of the connector for signs of contamination. Avoid touching either side of the connector as oil from your skin may be a source of contamination as well.
3. Visually inspect the terminal bearing surfaces of the flat wire circuits for splits, cracks, or other imperfections that could cause poor terminal contact. Visually inspect the component side connector to ensure that all of the terminals are uniform and free of damage or deformation.
4. Insert the appropriate adapter into the flat wire harness connector in order to test the circuit in question.

Control Module/Component Voltage and Grounds

Poor voltage or ground connections can cause widely varying symptoms.

- Test all control module voltage supply circuits. Many vehicles have multiple circuits supplying voltage to a control module. Other components in the system may have separate voltage supply circuits that may also need to be tested. Inspect connections at the module/component connectors, fuses, and any intermediate connections between the voltage source and the module/component. A test lamp or a DMM may indicate that voltage is present, but neither tests the ability of the circuit to carry sufficient current. Operate the component to test the ability of the circuit to carry sufficient current. Refer to [Circuit Testing](#) , and [Power Distribution Schematics](#) .
- Test all control module ground and system ground circuits. The control module may have multiple ground circuits. Other components in the system may have separate grounds that may also need to be tested. Inspect grounds for clean and tight connections at the grounding point (screw or stud). Inspect the connections at the component and in splice packs, where applicable. Operate the component to test the ability of the circuit to carry sufficient current. Refer to [Circuit Testing](#) , and [Ground Distribution Schematics](#) .

Temperature Sensitivity

- An intermittent condition may occur when a component/connection reaches normal operating temperature. The condition may occur only when the component/connection is cold, or only when the component/connection is hot.
- Freeze Frame, Failure Records, Snapshot, or Vehicle Data Recorder data may help with this type of intermittent condition, where applicable.
- If the intermittent is related to heat, review the data for a relationship with the following:
 - High ambient temperatures
 - Underhood/engine generated heat
 - Circuit generated heat due to a poor connection, or high electrical load
 - Higher than normal load conditions, towing, etc.
- If the intermittent is related to cold, review the data for the following:
 - Low ambient temperatures - In extremely low temperatures, ice may form in a connection or component. Inspect for water intrusion.
 - The condition only occurs on a cold start.
 - The condition goes away when the vehicle warms up.
- Information from the customer may help to determine if the trouble follows a pattern that is temperature related.
- If temperature is suspected of causing an intermittent fault condition, attempt to duplicate the condition. Refer to [Inducing Intermittent Fault Conditions](#) in order to duplicate the conditions required.

Electromagnetic Interference and Electrical Noise

Some electrical components/circuits are sensitive to electromagnetic interference or other types of electrical noise. Inspect for the following conditions:

- A mis-routed harness that is too close to high voltage/high current devices such as secondary ignition

components, motors, generator etc. - These components may induce electrical noise on a circuit that could interfere with normal circuit operation.

- Electrical system interference caused by a malfunctioning relay, or a control module driven solenoid or switch - These conditions can cause a sharp electrical surge. Normally, the condition will occur when the malfunctioning component is operating.
- Installation of non-factory or aftermarket add on accessories such as lights, 2-way radios, amplifiers, electric motors, remote starters, alarm systems, cell phones, etc. - These accessories may create interference in other circuits while operating and the interference would disappear when the accessory is not operating. Refer to [Checking Aftermarket Accessories](#) .
- Test for an open diode across the A/C compressor clutch and for other open diodes. Some relays may contain a clamping diode.
- The generator may be allowing AC noise into the electrical system.

Incorrect Control Module

- There are only a few situations where reprogramming a control module is appropriate:
 - A new service control module is installed.
 - A control module from another vehicle is installed.
 - Revised software/calibration files have been released for this vehicle.

NOTE: **DO NOT re-program the control module with the SAME software/calibration files that are already present in the control module. This is not an effective repair for any type of concern.**

- Verify that the control module contains the correct software/calibration. If incorrect programming is found, reprogram the control module with the most current software/calibration. Refer to [Control Module References](#) for replacement, setup, and programming.

FRONT SEAT HEATER CONTROL MODULE REPLACEMENT

Fig. 11: Front Seat Heater Control Module
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Seat Heater Control Module Fastener CAUTION: Refer to <u>Fastener</u> <u>Caution</u> . Tighten 2.5 N.m (22 lb in)
2	Front Seat Heater Control Module Procedure 1. Disconnect the electrical connector. 2. Disconnect the module from the bracket, then pull downward away from the bottom of the seat. 3. Refer to <u>Control Module References</u> for programming and setup information, if required.

DRIVER OR PASSENGER SEAT BACK HEATER REPLACEMENT

Fig. 12: Driver Or Passenger Seat Back Cushion Heater

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Refer to SIR Warning . WARNING: Do not repair or replace the seat stitching or seams in the seat back trim cover with an internal mounted seat side airbag module. Replace the complete seat back trim cover	

Callout	Component Name
from the OEM. Non-OEM seat stitching may cause improper airbag deployment which could result in personal injury.	
Preliminary Procedure Remove Driver or Passenger Seat Back Cover and Pad. Refer to <u>Driver or Passenger Seat Back Cover and Pad Replacement</u>	
1	Driver or Passenger Seat Back Cushion Cover
2	Driver or Passenger Seat Back Cushion Heater Procedure 1. Disconnect the electrical connector. 2. Remove the heater element leaving the old adhesive strips intact on the seat cushion. The new seat heater adhesive strips will be placed over the old adhesive strips.

FRONT SEAT CUSHION HEATER REPLACEMENT

Fig. 13: Front Seat Cushion Heater

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Refer to SIR Warning .	
Preliminary Procedure Remove Front Seat Cushion Cover and Pad. Refer to Front Seat Cushion Cover and Pad Replacement	
1	Front Seat Cushion Cover
2	Front Seat Cushion Pad
3	Front Seat Cushion Heater Procedure 1. Disconnect the heater element and peel away from the cushion to remove. 2. Note the routing of the wiring harness and connector location for installation.

REAR SEAT HEATER SWITCH REPLACEMENT

Fig. 14: Rear Seat Heater Switch

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Front Floor Console Rear Cup Holder. Refer to Front Floor Console Rear Cup Holder Replacement	
1	Rear Seat Heater Switch (Qty: 2) Procedure Release the tabs and remove the switch.

REAR SEAT HEATER CONTROL MODULE REPLACEMENT

Fig. 15: Rear Seat Heater Control Module

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
Remove Rear Seat Cushion. Refer to Rear Seat Cushion Removal and Installation	
1	Rear Seat Heater Control Module

REAR SEAT CUSHION HEATER REPLACEMENT

Fig. 16: Rear Seat Cushion Heater

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
Remove Rear Seat Cushion Cover and Pad. Refer to Rear Seat Cushion Cover and Pad Replacement	
1	Rear Seat Cushion Pad
2	Rear Seat Cushion Heater Procedure 1. Disconnect the electrical connectors. 2. Disconnect the heater element and peel away from the cushion to remove. 3. Note the routing of the wiring harness and connector location for installation.

DESCRIPTION AND OPERATION

HEATED SEATS DESCRIPTION AND OPERATION

Heated Seat Components

The heated seat system consists of the following components:

- Heated seat switches
- Body control module

- Seat heating control module
- Driver seat cushion heating element
- Driver seat cushion temperature sensor
- Driver seat back heating element
- Driver seat back temperature sensor
- Passenger seat cushion heating element
- Passenger seat cushion temperature sensor
- Passenger seat back heating element
- Passenger seat back temperature sensor

Heated Seat Switches

The driver and passenger heated seats are controlled by separate heated seat switches located on the center stack near the HVAC controls. The vehicle must be ON to operate the heated seat system. The BCM is the heated seat system master. It monitors heated seat switch activations to determine user requested operating mode. Based on the requested operating mode, the BCM sends a LIN Bus serial data message to the seat heating control module how to drive the self-regulated heating pads. The BCM also controls the indicators used to provide the operator with feedback as to the operating status of the system. With each press of the switch, the system will cycle through High, Medium, Low, and then back to Off again. The BCM also controls the seat temperature and mode indicators, via the serial data line, used to provide the operator with feedback as to the operating status of the system.

Heated Seat Operation

The seat heating control module controls heated seat operation for the driver and passenger seats. When active, power is applied to the seat cushion and back heater elements through a common pulse width modulated (PWM) voltage supply control circuit. Each individual heater element is switched to ground by the module through a common low side drive control circuit.

When inactive the seat heating control module connects the heating element low side outputs to a common reference point internal to the module which is biased to approximately 3.5 V. The module uses this biased voltage in order to check the high side and low side control circuits for a short to battery or ground before enabling the driver and passenger seat heating elements. During heated seat operation, the seat heating control module interrupts control of the heating elements every 10 s for approximately 10 ms to make this biased voltage check.

With both the seat cushion and seat back heater elements disconnected, if the high side output of the module is measured it will display a low current 12 V bleed off voltage. This bleed off voltage does not have a meaningful diagnostic purpose. With one or both of the heater elements connected you would just see the 3.5 V biased voltage from this circuit.

Temperature Regulation

The seat back and cushion temperature sensors (thermistors) are packaged with the seat heating elements located just under the seat covers. The seat heating control module supplies each temperature sensor with a 5 V reference signal circuit and a low reference circuit. The module monitors the voltage from the signal circuit to determine the temperature of the seat.

The temperature sensor varies in resistance based on the temperature of the heating element causing the signal voltage to change. Once the module senses the seat reached the set temperature, it will then begin regulate the current flow through the heater elements in order to maintain the desired seat temperature based on the feedback voltage from the sensor.

If the heated seats are on high, the temperature level may automatically be lowered after approximately 30 min of operation.

REAR HEATED SEATS DESCRIPTION AND OPERATION

Heated Seat Components

The rear heated seat system consists of the following components:

- Rear heated seat switches
- Body control module
- Rear seat heating control module
- Left rear seat cushion heating element
- Left rear seat cushion temperature sensor
- Right rear seat cushion heating element
- Right rear seat cushion temperature sensor

Heated Seat Switches

When a heated seat switch is pressed, the heated seat switch signal circuit from the body control module (BCM) is pulled low indicating the heated seat command. The BCM serves as the heated seat system master to determine the requested operating mode. The BCM then sends a LIN bus serial data message to the rear seat heating control module indicating the heated seat command. In response to this message, the seat heating control module attempts to drive the appropriate seat heating element per the BCM command.

Rear Heated Seat Operation

The rear seat heating control module controls heated seat operation for the left and right rear seats. When active, power is applied to the seat cushion and back heater elements through a common pulse width modulated (PWM) voltage supply control circuit. Each individual heater element is switched to ground by the module through a common low side drive control circuit.

When inactive the rear seat heating control module connects the heating element low side outputs to a common reference point internal to the control module which is biased to approximately 3.5 V. The control module uses this biased voltage in order to check the high side and low side control circuits for a short to battery or ground before enabling either the left or right rear seat heating element. During heated seat operation, the control module interrupts control of the heating elements every 10 s for approximately 10 ms to make this biased voltage check.

Temperature Regulation

The seat cushion temperature sensor (thermistors) is packaged with the seat heating element located just under the seat cover. The rear seat heating control module supplies the temperature sensor with a 5 V reference signal circuit and a low reference circuit. The control module monitors the voltage from the signal circuit to determine

the temperature of the seat.

The temperature sensor varies in resistance based on the temperature of the heating element causing the signal voltage to change. Once the rear seat heating control module senses the seat reached the set temperature, it will then begin regulate the current flow through the heater elements in order to maintain the desired seat temperature based on the feedback voltage from the sensor.

The temperature level may automatically be lowered after approximately 30 min of operation.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B3622: STEERING WHEEL CONTROLS SIGNAL CIRCUIT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC B3622

Steering Wheel Controls Signal Circuit

For symptom byte information refer to [Symptom Byte List](#).

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	U1510 00	U1510 00	-	-
Volume Up Signal-Terminal 8	B3622 39, B3622 59	1	-	-
Volume Down Signal-Terminal 7	B3622 39, B3622 59	1	-	-
Next Preset Signal-Terminal 9	B3622 39, B3622 59	1	-	-
Previous Preset Signal-Terminal 10	B3622 39, B3622 59	1	-	-
Serial Data	U1510 00, B3622 59	U1510 00	U1510 00, B3622 59	-
Low Reference	-	U1510 00	-	-
1. Steering Wheel Controls Inoperative				

Circuit/System Description

The steering wheel controls are divided into a right-hand set and left-hand set. The right - hand switch communicates with the instrument cluster through serial data and provides input from the rear left - hand switch and rear right - hand switch. The instrument cluster identifies the switch selection and activates the feature.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

B3622 39

An internal electrical malfunction has been detected in the steering wheel controls switch.

B3622 59

A stuck switch has been detected in the steering wheel controls switch.

Action Taken When the DTC Sets

No action is taken.

Conditions for Clearing the DTC

The DTC will clear when the conditions for setting the DTC are no longer present.

Circuit/System Verification

1. Ignition ON.
2. Verify all the associated primary controls on the radio (Volume, Mute, Seek, etc.) operate properly.
 - **If any of the primary controls do not function properly**

Refer to [Symptoms - Entertainment](#) .

- **If all of the primary controls function properly**
3. Verify the scan tool Steering Wheel Control Switches parameter changes when pressing the S70R Steering Wheel Controls Switch - Right buttons.
 - **If the parameter does not change for some of the S70R Steering Wheel Controls Switch - Right switches**

Replace S70R Steering Wheel Controls Switch - Right.
 - **If the parameter does not change for all of the S70R Steering Wheel Controls Switch - Right switches**

Refer to S70R Steering Wheel Controls Switch Circuit/System Testing.
 - **If the parameter changes for all S70R Steering Wheel Controls Switch - Right buttons**
 - 4. Verify the scan tool Steering Wheel Control Switches parameter changes between Volume Up and Volume Down when depressing the S70F Steering Wheel Controls Switch - Radio Volume switch.

- **If the parameter does not change**

Refer to S70F Steering Wheel Controls Switch - Radio Volume Circuit/System Testing.

- **If the parameter changes**

5. Verify the scan tool Steering Wheel Control Switches parameter changes between Next Preset and Previous Preset when depressing the S70E Steering Wheel Controls Switch - Radio Presets switch.

- **If the parameter does not change**

Refer to S70E Steering Wheel Controls Switch - Radio Presets Circuit/System Testing.

- **If the parameter changes**

6. All OK.

Circuit/System Testing

S70F Steering Wheel Controls Switch - Radio Volume

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S70F Steering Wheel Controls Switch - Radio Volume. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 3 and ground.

- **If 10 Ω or greater**

1. Ignition OFF.
2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 10 Ω**

3. Ignition ON.
4. Test for greater than 4.5 V between the signal circuit terminals listed below and ground:

- Terminal 1
- Terminal 2

- **If 4.5 V or less**

1. Ignition OFF, disconnect the harness connector at the S70R Steering Wheel Controls Switch - Right.
2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance

3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , test or replace the S70R Steering Wheel Controls Switch - Right.

- **If greater than 4.5 V**

5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the ground circuit terminal 3.
6. Verify the scan tool Steering Wheel Control Switches parameter is Volume Down Button.

- **If not Volume Down Button**

Test or replace the S70R Steering Wheel Controls Switch - Right.

- **If Volume Down Button**

7. Remove the jumper wire. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the ground circuit terminal 3.

8. Verify the scan tool Steering Wheel Control Switches parameter is Volume Up Button.

- **If not Volume Up Button**

Test or replace the S70R Steering Wheel Controls Switch - Right.

- **If Volume Up Button**

9. Test or replace the S70F Steering Wheel Controls Switch - Radio Volume.

S70E Steering Wheel Controls Switch - Radio Presets

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S70E Steering Wheel Controls Switch - Radio Presets. It may take up to 2 min for all vehicle systems to power down.

2. Test for less than 10 Ω between the ground circuit terminal 1 and ground.

- **If 10 Ω or greater**

1. Ignition OFF.

2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 10 Ω**

3. Ignition ON.

4. Test for greater than 4.5 V between the signal circuit terminals listed below and ground:

- Terminal 2

- Terminal 3

- **If 4.5 V or less**

1. Ignition OFF, disconnect the harness connector at the S70R Steering Wheel Controls Switch - Right.

2. Test for infinite resistance between the signal circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance

3. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω , test or replace the S70R Steering Wheel Controls Switch - Right.

- **If greater than 4.5 V**

5. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the ground circuit terminal 1.

6. Verify the scan tool Steering Wheel Control Switches parameter is Next Preset.

- **If not Next Preset**

Test or replace the S70R Steering Wheel Controls Switch - Right.

- **If Next Preset**

7. Remove the jumper wire. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the ground circuit terminal 1.

8. Verify the scan tool Steering Wheel Control Switches parameter is Previous Preset.

- **If not Previous Preset**

Test or replace the S70R Steering Wheel Controls Switch - Right.

- **If Previous Preset**

9. Test or replace the S70E Steering Wheel Controls Switch - Radio Presets.

S70R Steering Wheel Controls Switch-Right

1. Ignition OFF, disconnect the harness connector X1 at the P16 Instrument Cluster.

2. Disconnect the harness connector at the S70R Steering Wheel Controls Switch - Right. Ignition ON.

3. Test for less than 1 V between the S70R Steering Wheel Controls Switch - Right serial data circuit terminal 2 and ground.

- **If greater than 1 V**

Repair the short to voltage on the circuit.

- **If less than 1 V**

4. Ignition OFF.

5. Test for infinite resistance between the serial data circuit terminal 2 and ground.

- **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

6. Replace the S70R Steering Wheel Controls Switch - Right.

Component Testing

1. Ignition OFF, disconnect the harness connector at the S70F Steering Wheel Controls Switch - Radio Volume.

2. Test for infinite resistance between the following signal terminals and the ground terminal 3 with the switch in the open position.

- Terminal 1

- Terminal 2

- **If less than infinite resistance on either circuit**

Replace the S70F Steering Wheel Controls Switch - Radio Volume.

- **If infinite resistance**

3. Test for less than 10 Ω between the following signal terminals and the ground terminal 3 with the S70F Steering Wheel Controls Switch - Radio Volume in the Up position or Down position.

- Terminal 1
- Terminal 2
- **If 10 Ω or greater**

Replace the S70F Steering Wheel Controls Switch - Radio Volume.

- **If less than 10 Ω**

4. Ignition OFF, disconnect the harness connector at the S70E Steering Wheel Controls Switch - Radio Presets.

5. Test for infinite resistance between the following signal terminals and the ground terminal 1 with the switch in the open position.

- Terminal 2
- Terminal 3
- **If less than infinite resistance on either circuit**

Replace the S70E Steering Wheel Controls Switch - Radio Presets.

- **If infinite resistance**

6. Test for less than 10 Ω between the following signal terminals and the ground terminal 1 with the S70E Steering Wheel Controls Switch - Radio Presets in the Up position or Down position.

- Terminal 2
- Terminal 3
- **If 10 Ω or greater**

Replace the S70E Steering Wheel Controls Switch - Radio Presets.

- **If less than 10 Ω**

7. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Steering Wheel Spoke Cover Replacement**

SYMPTOMS - SECONDARY AND CONFIGURABLE CUSTOMER CONTROLS

NOTE: The following steps must be completed before using the symptom tables.

1. Perform the **Diagnostic System Check - Vehicle** before using the symptom tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.

- Review the system description and operation in order to familiarize yourself with the system functions. Refer to [Steering Wheel Controls Description and Operation](#).

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the steering wheel controls. Refer to [Checking Aftermarket Accessories](#).
- Inspect the easily accessible or visible system components, for obvious damage or conditions, which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#).

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

Refer to [Steering Wheel Controls Malfunction](#) in order to diagnose the symptom.

STEERING WHEEL CONTROLS MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	U1510 00	U1510 00	-	-
Volume Up Signal	B3622 39, B3622 59	1	-	-
Volume Down Signal	B3622 39, B3622 59	1	-	-
Next Preset Signal	B3622 39, B3622 59	1	-	-
Previous Preset Signal	B3622 39, B3622 59	1	-	-
Serial Data	-	U1510 00	-	-
Low Reference	-	U1510 00	-	-
1. Steering Wheel Controls Inoperative				

Circuit/System Description

The steering wheel controls are divided into a right-hand set and left-hand set. The right - hand switch

communicates with the instrument cluster through serial data and provides input from the rear left - hand switch and rear right - hand switch. The instrument cluster identifies the switch selection and activates the feature.

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON. Verify the driver information center (DIC) illuminates.

- **If the DIC does not illuminate**

Test or replace the instrument cluster.

- **If the DIC illuminates**

2. Verify all the associated primary controls on the radio (Volume, Mute, Seek, etc.) operate properly.

- **If any of the primary controls do not function properly**

Refer to Symptoms - Entertainment .

- **If all of the primary controls function properly**

3. Verify the scan tool Steering Wheel Control Switches parameter changes when pressing the S70R Steering Wheel Controls Switch - Right buttons.

- **If the parameter does not change for some of the S70R Steering Wheel Controls Switch - Right switches**

Replace S70R Steering Wheel Controls Switch - Right.

- **If the parameter does not change for all of the S70R Steering Wheel Controls Switch - Right**

switches

Refer to S70R Steering Wheel Controls Switch Circuit/System Testing.

- **If the parameter changes for all S70R Steering Wheel Controls Switch - Right buttons**

4. Verify the scan tool Steering Wheel Control Switches parameter changes between Volume Up and Volume Down when depressing the S70F Steering Wheel Controls Switch - Radio Volume switch.

- **If the parameter does not change**

Refer to S70F Steering Wheel Controls Switch - Radio Volume Circuit/System Testing.

- **If the parameter changes**

5. Verify the scan tool Steering Wheel Control Switches parameter changes between Next Preset and Previous Preset when depressing the S70E Steering Wheel Controls Switch - Radio Presets switch.

- **If the parameter does not change**

Refer to S70E Steering Wheel Controls Switch - Radio Presets Circuit/System Testing.

- **If the parameter changes**

6. All OK.

Circuit/System Testing

S70F Steering Wheel Controls Switch - Radio Volume

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S70F Steering Wheel Controls Switch - Radio Volume. It may take up to 2 min for all vehicle systems to power down.

2. Test for less than 10 Ω between the ground circuit terminal 3 and ground.

- **If 10 Ω or greater**

1. Ignition OFF.

2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 10 Ω**

3. Ignition ON.

4. Test for greater than 4.5 V between the signal circuit terminals listed below and ground:

- Terminal 1
- Terminal 2

- **If 4.5 V or less**

1. Ignition OFF, disconnect the harness connector at the S70R Steering Wheel Controls Switch - Right.

2. Test for infinite resistance between the signal circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , test or replace the S70R Steering Wheel Controls Switch - Right.

- **If greater than 4.5 V**

5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the ground circuit terminal 3.

6. Verify the scan tool Steering Wheel Control Switches parameter is Volume Down Button.

- **If not Volume Down Button**

Test or replace the S70R Steering Wheel Controls Switch - Right.

- **If Volume Down Button**

7. Remove the jumper wire. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the ground circuit terminal 3.

8. Verify the scan tool Steering Wheel Control Switches parameter is Volume Up Button.

- **If not Volume Up Button**

Test or replace the S70R Steering Wheel Controls Switch - Right.

- **If Volume Up Button**

9. Test or replace the S70F Steering Wheel Controls Switch - Radio Volume.

S70E Steering Wheel Controls Switch - Radio Presets

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S70E Steering Wheel Controls Switch - Radio Presets. It may take up to 2 min for all vehicle systems to power down.

2. Test for less than 10 Ω between the ground circuit terminal 1 and ground.

- **If 10 Ω or greater**

1. Ignition OFF.

2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 10 Ω**

3. Ignition ON.

4. Test for greater than 4.5 V between the signal circuit terminals listed below and ground:

- Terminal 2
- Terminal 3

- **If 4.5 V or less**

1. Ignition OFF, disconnect the harness connector at the S70R Steering Wheel Controls Switch - Right.

2. Test for infinite resistance between the signal circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , test or replace the S70R Steering Wheel Controls Switch - Right.

- **If greater than 4.5 V**

5. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the ground circuit terminal 1.

6. Verify the scan tool Steering Wheel Control Switches parameter is Next Preset.

- **If not Next Preset**

Test or replace the S70R Steering Wheel Controls Switch - Right.

- **If Next Preset**

7. Remove the jumper wire. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the ground circuit terminal 1.

8. Verify the scan tool Steering Wheel Control Switches parameter is Previous Preset.

- **If not Previous Preset**

Test or replace the S70R Steering Wheel Controls Switch - Right.

- **If Previous Preset**

9. Test or replace the S70E Steering Wheel Controls Switch - Radio Presets.

S70R Steering Wheel Controls Switch-Right

1. Ignition OFF, disconnect the harness connector X1 at the P16 Instrument Cluster.

2. Disconnect the harness connector at the S70R Steering Wheel Controls Switch - Right. Ignition ON.

3. Test for less than 1 V between the S70R Steering Wheel Controls Switch - Right serial data circuit terminal 2 and ground.

- **If greater than 1 V**

Repair the short to voltage on the circuit.

- **If less than 1 V**

4. Ignition OFF.

5. Test for infinite resistance between the serial data circuit terminal 2 and ground.

- **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

6. Replace the S70R Steering Wheel Controls Switch - Right.

Component Testing

1. Ignition OFF, disconnect the harness connector at the S70F Steering Wheel Controls Switch - Radio Volume.

2. Test for infinite resistance between the following signal terminals and the ground terminal 3 with the

switch in the open position.

- Terminal 1
- Terminal 2
- **If less than infinite resistance on either circuit**

Replace the S70F Steering Wheel Controls Switch - Radio Volume.

- **If infinite resistance**

3. Test for less than 10 Ω between the following signal terminals and the ground terminal 3 with the S70F Steering Wheel Controls Switch - Radio Volume in the Up position or Down position.

- Terminal 1
- Terminal 2
- **If 10 Ω or greater**

Replace the S70F Steering Wheel Controls Switch - Radio Volume.

- **If less than 10 Ω**

4. Ignition OFF, disconnect the harness connector at the S70E Steering Wheel Controls Switch - Radio Presets.

5. Test for infinite resistance between the following signal terminals and the ground terminal 1 with the switch in the open position.

- Terminal 2
- Terminal 3
- **If less than infinite resistance on either circuit**

Replace the S70E Steering Wheel Controls Switch - Radio Presets.

- **If infinite resistance**

6. Test for less than 10 Ω between the following signal terminals and the ground terminal 1 with the S70E Steering Wheel Controls Switch - Radio Presets in the Up position or Down position.

- Terminal 2
- Terminal 3
- **If 10 Ω or greater**

Replace the S70E Steering Wheel Controls Switch - Radio Presets.

- **If less than 10 Ω**

7. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Steering Wheel Spoke Cover Replacement**

REPAIR INSTRUCTIONS

RESET TEEN DRIVER KEY PIN

If the PIN has been lost the only way to clear a Teen Key is to follow the Body Control Module (BCM) Configuration/Reset Functions Reset Teen Driver Key PIN procedure in the scan tool. This procedure will clear all Teen Keys

- 1. Connect a scan tool to the vehicle.
- 2. Select the Reset Teen Driver Key PIN.
- 3. After resetting the PIN, all teen keys will be cleared.
- 4. Verify teen keys are cleared.

DESCRIPTION AND OPERATION

STEERING WHEEL CONTROLS DESCRIPTION AND OPERATION

Fig. 2: Secondary Controls Block Diagram

Callout	Component Name
---------	----------------

Callout	Component Name
S70E	Steering Wheel Controls Switch - Radio Presets
S70F	Steering Wheel Controls Switch - Radio Volume
S70R	S70R Steering Wheel Controls Switch - Right
P16	P16 Instrument Cluster
A11	A11 Radio

The steering wheel control switches duplicate the function of the primary controls of the associated component, through a network of momentary contact switches.

The Steering Wheel Controls are divided into a right-hand set and left-hand set. The right-hand switch is connected to the IPC LIN serial data and provides input from the left-hand, left-hand rear, and right-hand rear switches

The right-hand switch controller consists of UP/DOWN/LEFT/RIGHT directional, center "select", Push-to-Talk, and Mute buttons. The LEFT/RIGHT buttons navigate the display regions of the cluster. The UP/DOWN buttons navigate the menus. The right-hand rear switch consists of volume up and volume down buttons. The left-hand rear switch consists of favorite up and favorite down buttons.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B291A: CONTENT THEFT DETERRENT ASSEMBLY INTERNAL MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC B291A 39

Content Theft Deterrent Assembly Internal Malfunction

Circuit/System Description

The body control module performs various internal fault detection test to determine if a software or hardware concern exists within the power sounder. No external circuits are involved.

Conditions for Running the DTC

- The vehicle is OFF.
- The vehicle is in Park.

Conditions for Setting the DTC

The Body Control Module has detected an internal failure within the Content Theft Deterrent Sensor Module.

Action Taken When the DTC Sets

The intrusion and inclination functionality is disabled.

Conditions for Clearing the DTC

- A current DTC is cleared when the conditions for setting the DTC are no longer present.
- A history DTC will clear after 40 malfunction free vehicle cycles.

Circuit/System Testing

1. Vehicle OFF and vehicle systems OFF, disconnect the harness connector at the B165 Content Theft Deterrent Sensor Module. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 5 and ground.
 - **If 10 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is OK and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Vehicle OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the B165 Content Theft Deterrent Sensor Module.
 - **If the test lamp illuminates**
5. Vehicle OFF, arm the content theft deterrent system.
6. Test for greater than 4.5 V between the serial data circuit terminal 4 and ground.
 - **If 4.5 V or less**
 1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the serial data circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the serial data circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If greater than 4.5 V**
7. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module.
8. Test for less than 1 V between the B165 Content Theft Deterrent Sensor Module serial data circuit terminal 4 and ground.

- **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

9. Replace the B165 Content Theft Deterrent Sensor Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for Body Control Module replacement, programming, and setup

SYMPTOMS - THEFT DETERRENT

NOTE: The following steps must be completed before using the symptom tables.

1. Perform **Diagnostic System Check - Vehicle** in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to the following **Theft Systems Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Theft Deterrent System. Refer to **Checking Aftermarket Accessories**.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections**.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Content Theft Deterrent Malfunction (without UTT or UTP)Content Theft Deterrent Malfunction (with UTP)Content Theft Deterrent Malfunction (with UTT)**
- **Inclination/Intrusion Sensor Malfunction**
- **Theft Deterrent Alarm Malfunction (with UTR)Theft Deterrent Alarm Malfunction (with UTP)**

CONTENT THEFT DETERRENT MALFUNCTION (WITHOUT UTT OR UTP)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Circuit/System Description

The content theft deterrent system is a software based system in which the Body Control Module (BCM) actively monitors certain inputs to determine if unauthorized vehicle access is being attempted. Based on inputs such as the door ajar switches, the rear compartment ajar switch, and the hood ajar switch, the BCM determines whether a content theft deterrent alarm is warranted. If unauthorized access is being detected, the BCM will pulse the vehicle horn and flash the exterior lamps as a means of theft deterrence.

Diagnostic Aids

The scan tool BCM Content Theft Deterrent Trigger History 1, 2, and 3 parameters can be used to help isolate an intermittent unwanted content theft deterrent alarm. These parameters are a rolling history of the previous three causes of a theft deterrent alarm. If all three parameters are indicating the same alarm trigger, the indicated input should be the starting point when diagnosing an intermittent concern.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B165 Content Theft Deterrent Sensor Module. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 5 and ground.
 - **If 10 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is OK and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Vehicle OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the B165 Content Theft Deterrent Sensor Module.

- **If the test lamp illuminates**

5. Vehicle OFF, arm the content theft deterrent system.

6. Test for greater than 4.5 V between the serial data circuit terminal 4 and ground.

- **If 4.5 V or less**

1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module.

2. Test for infinite resistance between the serial data circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance

3. Test for less than 2 Ω in the serial data circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω , replace the K9 Body Control Module.

- **If greater than 4.5 V**

7. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module.

8. Test for less than 1 V between the B165 Content Theft Deterrent Sensor Module serial data circuit terminal 4 and ground.

- **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

9. Vehicle OFF, connect the harness connector at the B165 Content Theft Deterrent Sensor Module.

Disconnect the harness connector at the S48B Multifunction Switch - Overhead Console. It may take up to 2 minutes for all vehicle systems to power down.

10. Test for less than 10 Ω between the ground circuit terminal 2 and ground.

- **If 10 Ω or greater**

1. Vehicle OFF.

2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 10 Ω**

11. Vehicle OFF, connect the harness connector at the S48B Multifunction Switch - Overhead Console.

Disconnect the harness connector at the B165 Content Theft Deterrent Sensor Module, vehicle in Service Mode.

12. Test for less than 1 V between the circuit terminal listed below and ground:

- Control circuit terminal 2

- Signal circuit terminal 4

- **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

13. Connect a 3 A fused jumper wire between the control circuit terminal 2 and B+.
14. Verify the intrusion/inclination sensor disable LED is illuminated.
 - **If the indicator is not illuminated**
 1. Vehicle OFF, remove the jumper wire, disconnect the harness connector at the S48B Multifunction Switch - Overhead Console.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, replace the open/high resistance in the circuit.
 - If less than 2 Ω , test or replace the S48B Multifunction Switch - Overhead Console.
 - **If the indicator is illuminated**
15. Test for infinite resistance between the signal circuit terminal 1 and ground.
 - **If less than infinite resistance**
 1. Vehicle OFF, disconnect the harness connector at the S48B Multifunction Switch - Overhead Console.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, test or replace the S48B Multifunction Switch - Overhead Console.
 - **If infinite resistance**
16. Test for less than 10 Ω between the signal circuit terminal 1 and ground with the intrusion/inclination sensor disable switch pressed.
 - **If 10 Ω or greater**
 1. Vehicle OFF, disconnect the harness connector at the S48B Multifunction Switch - Overhead Console.
 2. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, replace the open/high resistance in the circuit.
 - If less than 2 Ω , test or replace the S48B Multifunction Switch - Overhead Console.
 - **If less than 10 Ω**
17. Replace the B165 Content Theft Deterrent Sensor Module.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	1	1	1	-
Serial Data	U1522	1	U1522	-
Ground	-	1	-	-
1. Content theft deterrent power sounder inoperative				

Circuit/System Description

The content theft deterrent system uses the power sounder to provide an audible alert when in the alarm mode. The power sounder receives a constant B+ and ground. The Body Control Module commands the power sounder via serial data. The power sounder is also equipped with a battery backup. If the power sounder is disconnected while the vehicle is OFF, the battery backup will allow the power sounder to sound the audible content theft deterrent alert.

- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Relay Switch B+	1	1	-	-
Relay Coil B+	1	1	-	-
Relay Coil Control	2	1	1	-
Security Siren Control	1	1	2	-
Ground	-	1	-	-
1. Security siren inoperative 2. Security siren always on				

Circuit/System Description

The content theft deterrent system uses the security to provide an audible alert when in the alarm mode. The security siren is controlled by the Body Control Module through the security siren relay. The security siren relay coil and switch each receive B+ at all times. When the content theft deterrent system determines that an alarm condition exists, it will pulse the security siren by grounding the security siren relay control circuit. This will create an electromagnetic field in the relay and pull the relay switch closed, applying B+ to the security siren, causing it to sound.

[Circuit/System Testing](#)

1. Vehicle OFF and all vehicle systems OFF, disconnect the KR101 Security Siren Relay, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminals listed below and ground:
 - Terminal 2
 - Terminal 3
 - **If the test lamp does not illuminate**
 Test or replace the X50A Fuse Block - Underhood.
 - **If the test lamp illuminates**
3. Test for less than 1 V between the control circuit terminal 4 and ground.
 - **If 1 V or greater**
 Repair the short to voltage on the circuit.
 - **If less than 1 V**
4. Vehicle OFF.
5. Connect a test lamp between the B+ circuit terminal 2 and the control circuit terminal 1.
6. Completely lower the driver door window and close all vehicle doors. Arm the content theft deterrent system by locking the doors with the keyless entry transmitter. Wait 30 seconds for the content theft deterrent system to arm.
7. Without disarming the system, reach in through the open driver window and open the driver door.
8. Verify the test lamp turns ON and OFF.
 - **If the test lamp is always ON**
 1. Disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If the test lamp is always OFF**
 1. Disconnect the harness connector at the K9 Body Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V
3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
9. Disconnect the harness connector at the P4 Security Siren.
 10. Test for less than 10 Ω between the ground circuit terminal B and ground.
 - **If 10 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
 11. Connect the harness connector at the P4 Security Siren.
 12. Connect a 10 A fused jumper wire between the B+ circuit terminal 3 and the control circuit terminal 4.
 13. Verify the P4 Security Siren is sounding.
 - **If the P4 Security Siren is not sounding**
 1. Disconnect the harness connector at the P4 Security Siren.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , test or replace the P4 Security Siren.
 - **If the P4 Security Siren is sounding**
 14. Test or replace the KR101 Security Siren Relay.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Relay Replacement \(Attached to Wire Harness\)](#) [Relay Replacement \(Within an Electrical Center\)](#)
- Refer to [Control Module References](#) for Body Control Module replacement, programming, and setup

DESCRIPTION AND OPERATION

THEFT SYSTEMS DESCRIPTION AND OPERATION

When armed, the content theft deterrent system is designed to deter vehicle content theft by pulsing the horns and exterior lamps for approximately 30 seconds when an unauthorized vehicle entry is detected. If equipped, a siren will also be activated. However, the content theft deterrent system does not affect engine starting.

An unauthorized entry can be any of the following with the content theft deterrent system armed:

- When any door is opened without using the UNLOCK command from a keyless entry transmitter
- Unauthorized entry into the underhood area
- Unauthorized entry into the rear compartment
- Unauthorized access to the charge port
- Disconnection of the charge cord when charging
- After a battery reconnect, if the battery was disconnected with the content theft deterrent system armed

The components of the content theft deterrent system are:

- Body Control Module (BCM)
- Remote Control Door Lock Receiver
- Security Indicator
- Door Ajar Switches
- Rear Compartment Ajar Switch
- Hood Ajar Switch
- Charge Port Door Ajar Switch
- External siren, if equipped

Arming the Content Theft Deterrent System

Use the following procedure in order to arm the system:

1. Place the shift lever in P (park).
2. Turn the vehicle OFF.
3. Open any door.

NOTE: The system is not armed if the doors are locked manually; the power door lock switch or remote keyless entry transmitter must be used to arm the content theft deterrent system.

4. Lock the doors with the power door lock switch or the LOCK button on the transmitter. The system is in standby mode and will not start the arming timer until all doors are closed.
5. The system will begin the arm sequence immediately after the last door is closed. If the keyless entry transmitter is used to arm the system after the vehicle doors are closed, the arm sequence will begin as soon as the LOCK command is received from the transmitter.
6. Immediately pressing the LOCK button a second time will bypass the delayed arming function and immediately arm the system.

Locking the Vehicle Without Arming the Content Theft Deterrent System

Locking the vehicle may be accomplished without arming the content theft deterrent system. Use of the manual door locks or using the key to lock the doors will lock the vehicle, but will not arm the content theft deterrent system.

Disarming an Armed System/Silencing an Alarm

If system arming has been requested by the power door lock switch or the keyless entry transmitter, it must be disarmed.

NOTE: **Disconnecting the battery or pulling fuses does not disable the arm mode, since the BCM stores the content theft deterrent alarm status in memory.**

- To disarm the content theft deterrent system in standby mode, perform one of the following:
 - Press either power door unlock switch.
 - Press the UNLOCK button on the keyless entry transmitter.
- To disarm the content theft deterrent system in the armed mode (non-event) or when activated (during an alarm event):
 - Press the UNLOCK button on the keyless entry transmitter.
 - Press the vehicle ON/OFF switch with a valid key in the vehicle

Content Theft Deterrent Circuit Description

The following is a description of each component used in the content theft deterrent system:

Body Control Module

The content theft deterrent system is an internal function of the BCM which utilizes serial data and various switch inputs information to perform content theft deterrent functions. When the BCM detects an unauthorized entry, it activates the horns and exterior lamps. The BCM has 4 basic modes (disarmed, standby, armed, and alarm) for operating the content theft deterrent system. The different modes are described below.

1. The BCM has the content theft deterrent system in a disarmed mode until the following conditions are detected:
 - Vehicle OFF.
 - Doors locked by either the power door lock switch or the LOCK button on the transmitter.
2. The BCM enters the standby mode when the above conditions are detected. If a door was already opened when the arm mode was requested, the standby mode does not start the timer until the last door is closed.
3. When the last door is closed, a 30 second timer is activated. Once the timer has expired, the BCM enters the armed mode. After this delay, any forced entry activates the alarm mode.
4. When the BCM detects a forced entry, the BCM enters the alarm mode. The BCM activates the horns and exterior lamps for 30 seconds. If equipped, a siren will also be activated. This is followed by a three minute time-out with the horn no longer active. If no new intrusions are detected after the time-out, the horn is not active. The system must be disarmed or the intrusion condition removed after the time-out for the system to exit alarm mode.

Remote Control Door Lock Receiver

The keyless entry system can arm and disarm the content theft deterrent system. When the remote control door lock receiver receives a door lock or unlock signal from the transmitter, the remote control door lock receiver sends a message to the BCM via serial data to perform the appropriate arm/disarm functions.

Security Indicator

The security indicator is illuminated in the instrument panel. The content theft deterrent system uses the security indicator to inform the driver of system status prior to arming.

Door Ajar Switches

The content theft deterrent system uses the door ajar switches as a status indicator to activate the alarm. The door ajar switches are monitored by the body control module via a discrete input from each door ajar switch. If the BCM receives a signal indicating a door is opened when the content theft deterrent system is armed, the BCM activates the alarm.

Hood Ajar Switch

The content theft deterrent system uses the hood ajar switch as a status indicator to activate the alarm. The BCM monitors the hood ajar switch via a discrete input from the switch. If the BCM receives a signal indicating the hood has been opened when the content theft deterrent system is armed, the BCM activates the alarm.

Rear Compartment Ajar Switch

The content theft deterrent system uses the rear compartment ajar switch as a status indicator to activate the alarm. The BCM monitors the rear compartment ajar switch via a discrete input from the switch. If the BCM receives a signal indicating the rear compartment has been opened when content theft deterrent system is armed, the BCM activates the alarm.

Charge Port Door Ajar Switch

The content theft deterrent system uses the charge port door ajar switch as a status indicator to activate the alarm. If the BCM receives a signal indicating the charge port door has been opened when content theft deterrent system is armed, the BCM activates the alarm. Additionally, if the BCM receives a message that the charge port cord is disconnected from the vehicle while the content theft deterrent is armed, the BCM will active the alarm.

Inputs

The BCM monitors the following inputs for content theft deterrent:

- The door ajar switches
- The keyless entry transmitter LOCK/UNLOCK buttons; a message from the Remote function receiver module/Remote control door lock receiver
- The immobilizer status - The BCM uses the immobilizer status for disarming the system or silencing an alarm when the correct vehicle key is used to start the vehicle
- The rear compartment ajar switch
- The hood ajar switch
- The charge port door ajar switch

Outputs

The BCM controls the following for content theft deterrent:

- The horn relay
 - The exterior lamps
 - Siren, if equipped
-

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC C0569: SYSTEM CONFIGURATION MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC C0569 00

System Configuration Malfunction

Circuit/System Description

If the tire type and pressure information is not entered during the body control module (BCM) setup, the tire pressure monitor system indicator icon on the instrument cluster will flash for 1 min and then remain illuminated after the ignition is cycled ON and the instrument cluster bulb check is complete. If equipped, the driver information center will also display a service tire monitor type message. Under these circumstances, DTC C0569 will be set and the tire type and pressure information will need to be entered for the system to function correctly.

Conditions for Running the DTC

Ignition On/Vehicle in Service Mode.

Conditions for Setting the DTC

The tire type and pressure information is not entered into the BCM during programming and setup.

Action Taken When the DTC Sets

- The tire pressure monitor system indicator icon on the instrument cluster flashes for 1 min and then remains illuminated after the ignition switch is cycled ON and the instrument cluster bulb check is complete.
- If equipped, the driver information center displays a service tire monitor type message.

Conditions for Clearing the DTC

A current DTC will clear when the BCM has undergone the tire type and pressure selection setup procedure and one ignition cycle has occurred.

Diagnostic Aids

A newly replaced BCM will set DTC C0569 after programming on it's initial ignition ON cycle if the module setup information has not been entered.

Reference Information

Description and Operation

Tire Pressure Monitor Description and Operation (UJM)

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition On/Vehicle in Service Mode.
2. Enter the tire type and pressure information into the K9 Body Control Module with a scan tool. Refer to Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label.
3. Ignition OFF, then Ignition On/Vehicle in Service Mode.
4. Verify DTC C0569 is not set.
 - **If the DTC is set**

Replace the K9 Body Control Module.
 - **If the DTC is not set.**
5. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Refer to Control Module References for control module replacement, programming, and setup.

DTC C0750, C0755, C0760, OR C0765: TIRE PRESSURE SENSORS

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.

- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Right Rear Tire Pressure Sensor Internal Malfunction

Circuit/System Description

The tire pressure monitor system has a radio frequency (RF) transmitting pressure sensor in each wheel/tire assembly. As vehicle speed increases, centrifugal force puts the sensor into Drive mode. The sensors send the tire pressure data to the remote control door lock receiver (RCDLR) which in turn translates the received sensor data into sensor presence, sensor mode, and tire pressure before passing it onto the body control module (BCM). Once vehicle speed is greater than 40 km/h (25 MPH), the BCM waits for the first sensor to go into Drive mode, then checks if all sensors have gone into Drive mode. If one or more sensors does not go into these modes, or does not transmit at all, the BCM will set DTC C0750, C0755, C0760, or C0765 respectively.

Conditions for Running the DTC

Vehicle speed is greater than 40 km/h (25 MPH).

Conditions for Setting the DTC

- A sensor does not transmit or transmits invalid data to the BCM.
- A sensor low battery condition.

Action Taken When the DTC Sets

- The tire pressure monitor system indicator icon on the instrument cluster flashes for 1 min and then remains illuminated after the ignition switch is cycled ON and the instrument cluster bulb check is complete.
- If equipped, the driver information center displays a service tire monitor type message.

Conditions for Clearing the DTC

A current DTC will clear when the malfunction is no longer present and one ignition cycle occurs.

Diagnostic Aids

- Some aftermarket wheel valve stem holes are located further from the wheel rim than original equipment wheels. When using the tire pressure monitor special tool to activate a sensor, ensure the tool is placed along the tire sidewall and no further than 15 cm (6 in) from the sensor and the antenna is aiming upward.
- Aftermarket wheel valve system locations can cause a sensor to not function correctly.
- A sensor may have been damaged due to a previous wheel/tire service or flat tire event.
- The use of other than GM approved tire sealants can obstruct the sensor pressure sensing port and cause inaccurate tire pressure readings. If this condition is verified, remove the sealer from the tire and replace the sensor. Refer to [Tire Pressure Indicator Sensor Replacement](#).
- Occasionally sensor transmissions are not received by the BCM due to vehicle level radio frequency interference from items such as but not limited to aftermarket ignition systems, DVD players, CB radios, or metallic type window tinting.
- The sensor activation procedure may have to be repeated up to 3 times before determining a sensor is malfunctioning. In the event a particular sensor information is displayed on the special tool upon activation but the horn does not chirp, it may be necessary to rotate the wheel valve stem to a different position due to the RF signal being blocked by another component.
- Occasionally sensors can become mislocated due to previous tire rotations where the sensor learn procedure was not performed. Always learn the sensors to ensure the DTC set is for that actual physical corner of the vehicle. Refer to [Tire Pressure Indicator Sensor Learn](#).
- A sensor low battery condition will set a sensor DTC but will not illuminate the low tire pressure indicator or display a message on the driver information center, if equipped. The sensor battery condition can be verified in the scan tool BCM data list. If a sensor low battery condition is indicated on the scan tool, the sensor will need

to be replaced. Refer to [Tire Pressure Indicator Sensor Replacement](#).

- The Hit Rate of the sensor will help confirm the success rate at which the sensor transmission is being received. A low Hit Rate will signal that there may be interference.

Reference Information

Description and Operation

Circuit/System Verification

1. Verify there are no communication DTCs set along with DTC C0750, C0755, C0760, and C0765.
 - **If a communication DTC is set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
 - **If a communication DTC is not set**
2. Verify the scan tool Tire Pressure Sensor Rolling Count parameter of all 4 tire pressure sensors is above 50%.
 - **If the Tire Pressure Sensor Rolling Count parameter is below 50% on one or more tires**

NOTE: When moving the tire pressure sensor to a different location on the vehicle, keep the tire pressure sensor with the original tire it is installed in.

1. Move the appropriate tire to a different location on the vehicle and verify the Tire Pressure Sensor Rolling Count has increased. Refer to [Tire and Wheel Removal and Installation](#) .
 - If Tire Pressure Sensor Rolling Count parameter does not increase after moving tire to different location, replace the appropriate B2 Tire Pressure Sensor and perform the [Tire Pressure Indicator Sensor Learn](#).
 - If Tire Pressure Sensor Rolling Count parameter does increase after moving tire to different location, check for any aftermarket devices that could be causing interference to the tire pressure sensor signal.
 - **If the Tire Pressure Sensor Rolling Count parameter is above 50% on one or more tires**
3. Verify if all 4 tire monitor pressure sensor DTCs are not set.
 - If 2 or more tire monitor pressure sensor DTCs are set, test the keyless entry antenna for proper operation, or if antenna is properly seated. Refer to [Keyless Entry System Malfunction \(Active\)](#) [Keyless Entry System Malfunction \(Passive\)](#)
4. Perform the [Tire Pressure Indicator Sensor Learn](#).
5. Verify the scan tool Tire Pressure Sensor Mode parameters change to Drive while driving the vehicle above 40 km/h (25 mph) for greater than 2 min.
 - **If a Tire Pressure Sensor Mode parameter does not change to Drive**
 1. Replace the appropriate B2 Tire Pressure Sensor.
 2. Perform the [Tire Pressure Indicator Sensor Learn](#).

- If the Tire Pressure Sensor Mode parameter changes to Drive

6. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Tire Pressure Indicator Sensor Replacement](#)
- Refer to [Tire Pressure Indicator Sensor Learn](#)

DTC C0775: TIRE PRESSURE MONITORING SYSTEM SENSORS MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC C0775 00

Tire Pressure Monitoring System Sensors Malfunction

Circuit/System Description

If the body control module (BCM) has been reprogrammed or replaced and the tire pressure sensor learn procedure has not been performed, the tire pressure monitor system indicator icon on the instrument cluster will flash for 1 min and then remain illuminated after the power switch is cycled ON and the instrument cluster bulb check is complete. If equipped, the driver information center will also display a service tire monitor type message. Under these circumstances, DTC C0775 will be set in the BCM and the tire pressure sensor learn procedure will need to be performed for the system to function correctly.

Conditions for Running the DTC

Vehicle ON or Vehicle in Service Mode.

Conditions for Setting the DTC

The body control module (BCM) has not learned tire pressure sensor ID and location information from the tire pressure sensors.

Action Taken When the DTC Sets

- The tire pressure monitor system indicator icon on the instrument cluster will flash for 1 min and then remain illuminated after the power switch is cycled ON and the instrument cluster bulb check is complete.
- If equipped, the driver information center displays a service tire monitor type warning message.

Conditions for Clearing the DTC

A current DTC will clear when the BCM has received tire pressure sensor ID and location after tire pressure sensor indicator learn procedure has been performed.

Reference Information

Description and Operation

Tire Pressure Monitor Description and Operation (UJM)

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Perform the Tire Pressure Indicator Sensor Learn.
2. Verify DTC C0775 is not set.
 - **If the DTC is set**
 1. Test the keyless entry antenna for proper operation. Refer to Keyless Entry System Malfunction (Active) Keyless Entry System Malfunction (Passive) .
 2. Clear DTC.
 3. Verify DTC does not set.
 - If the DTC sets, replace the K9 Body Control Module.
 - If the DTC does not set.
 - **If the DTC is not set**
3. All OK.

All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Refer to Control Module References for control module replacement, programming, and setup.

SYMPTOMS - TIRE PRESSURE MONITORING

1. Perform the Diagnostic System Check - Vehicle , before using the Symptom Tables in order to verify that all of the following are true:
 - The control modules can communicate via the serial data link.
 - If one of the current or previous sensor learn is not successful.
 - If there are dashes displayed in the driver information center. Refer to Tire Pressure Rolling Count Procedure
2. Review the system operation in order to familiarize yourself with the system functions. Refer to Tire Pressure Monitor Description and Operation (UJM).

Visual/Physical Inspection

- Inspect if tires are inflated per placard values.
- Inspect for aftermarket devices which could affect the operation of the Tire Pressure Monitoring (TPM) System. Refer to Checking Aftermarket Accessories .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to [Low Tire Pressure Indicator Malfunction](#) in order to diagnose the symptom.

LOW TIRE PRESSURE INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Circuit/System Description

The tire pressure monitor system has a radio frequency transmitting pressure sensor in each wheel/tire assembly. As vehicle speed increases, centrifugal force puts the sensor into Drive mode. The sensors send the tire pressure data to the remote control door lock receiver (RCDLR), using radio frequency (RF) transmissions. The RCDLR then decodes the RF data and passes it to the body control module (BCM). In turn, the BCM translates the data contained in the tire pressure sensor radio frequency transmissions into sensor presence, sensor mode, and tire pressure. Once vehicle speed is greater than 40 km/h (25 MPH), the BCM waits for the sensors to go into Drive mode.

Each sensor has its own unique identification (ID) code, which it transmits as part of each RF message, that must be learned into the BCM memory. Once all 4 IDs have been learned and vehicle speed is greater than 40 km/h (25 mph), the BCM continuously compares IDs and pressure data in the received transmissions to the learned IDs and vehicle placard pressures to determine if all 4 sensors are present and if one or more tires are low. If the BCM detects a low tire pressure condition or a malfunction in the system, it will send a serial data message to the instrument cluster requesting the appropriate tire pressure monitor indicator illumination and also to display the appropriate data message on the driver information center, if equipped.

Diagnostic Aids

- If unsure about the condition, cycle the ignition and observe the tire pressure monitor indicator icon. If the tire pressure monitor indicator icon is continuously illuminated after the instrument cluster bulb check is completed, a low tire pressure condition is present. Check the tires for damage or leaks and inflate to the tire placard specifications. Refer to [Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label](#) . If the tire pressure monitor indicator icon flashes for 1 min after the instrument cluster bulb check is completed and then remains illuminated, a tire pressure monitor system DTC is set. Perform the [Diagnostic System Check - Vehicle](#) to proceed with the proper diagnosis.
- Temperature can greatly effect tire pressures. Low tire pressure on a cold morning may cause the tire pressure monitor indicator icon to turn ON. The air pressure in the tire increases as the ambient temperature rises or as the tire warms up while the vehicle is driven. The pressure may increase enough to exceed the predetermined low pressure threshold which will turn OFF the tire pressure monitor indicator icon.
- Some aftermarket wheel valve stem holes are located further from the wheel rim than original equipment wheels. When using the tire pressure monitor special tool to activate a sensor, ensure the tool antenna is no further than 15 cm (6 in) from the sensor and is aiming upward.
- Aftermarket wheel valve stem locations can cause a sensor to not function correctly.

- A sensor may have been damaged due to a previous wheel/tire service or flat tire event. This is a courtesy item as it is not covered by warranty.
- The use of other than GM approved tire sealants can obstruct the sensor pressure sensing port and cause inaccurate tire pressure readings. If this condition is verified, remove the sealer from the tire and replace the sensor. Refer to [Tire Pressure Indicator Sensor Replacement](#).
- The sensor activation procedure may have to be repeated up to 3 times before determining a sensor is malfunctioning. In the event a particular sensor's information is displayed on the special tool upon activation but the horn does not chirp, it may be necessary to rotate the wheel valve stem to a different position due to the RF signal is being blocked by another component.
- Occasionally sensor transmissions are not received by the BCM due to vehicle level RF interference from items such as but not limited to aftermarket ignition systems, DVD players, CB radios, or metallic type window tinting.
- The Hit Rate of the sensor will help confirm the success rate at which the sensor transmission is being received. A low Hit Rate will signal that there may be interference. Refer to [Tire Pressure Rolling Count Procedure](#).

Reference Information

Description and Operation

[Tire Pressure Monitor Description and Operation \(UJM\)](#)

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

NOTE: Low tire pressure in one or more tires is indicated by a continuously illuminated tire pressure monitor indicator icon after the instrument cluster bulb check is completed. If equipped with a driver information center, a check tire pressure type message will also be displayed.

When a tire pressure monitor DTC is set, the tire pressure monitor indicator icon will flash for 1 min after the instrument cluster bulb check is completed and then remains illuminated. If equipped with a driver information center, a service tire monitor type message will also be displayed.

1. Adjust all tire pressures to the correct pressure. Refer to [Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label](#).
2. Drive the vehicle over 40 km/h (25 mph) for greater than 2 min.
3. Verify the low tire pressure indicator is OFF.
 - **If the low tire pressure indicator is ON**
 1. Perform the [Tire Pressure Indicator Sensor Learn](#).
 2. Record all 4 Tire Pressure Parameters values from the scan tool.
 3. Check and record the tire pressures with a known accurate hand held tire pressure gauge.
 4. Verify that the scan tool Tire Pressure parameters do not differ more than 27.6 kPa (4 psi) from the actual tire pressure readings.
 - If the scan tool Tire Pressure parameters differ more than 27.6 kPa (4 psi), replace the appropriate

B2 Tire Pressure Sensor then perform the [Tire Pressure Indicator Sensor Learn](#).

- If the scan tool Tire Pressure parameters do not differ more than 27.6 kPa (4 psi)

5. Verify the BCM Tire Type and Pressure selections are setup correctly with a scan tool. Refer to the [Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label](#) .

- If the BCM Tire Type and Pressure selections are incorrect, input the proper placard values for the vehicle with the scan tool then drive the vehicle over 40 km/h (25 mph) for greater than 2 min.
- If the BCM Tire Type and Pressure selections are correct

6. Ignition On/Vehicle in Service Mode.

7. Verify the low tire pressure monitor indicator icon turns ON and OFF when commanding All Indicators ON and OFF with a scan tool.

- If the low tire pressure monitor icon does not turn ON and OFF, replace the P16 Instrument Cluster.
- If the low tire pressure monitor icon turns ON and OFF

8. All OK

- **If the tire pressure indicator is OFF**

4. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Tire Pressure Indicator Sensor Replacement](#)
- Refer to [Tire Pressure Indicator Sensor Learn](#)
- Refer to [Control Module References](#) for control module replacement, programming, and setup.

TIRE PRESSURE ROLLING COUNT PROCEDURE

Introduction

The Tire Pressure Rolling Count parameter for each sensor can be used to help confirm if the sensor transmissions are being received. As the vehicle is being driven, the Tire Pressure Rolling Count increments with every received TPM sensor transmission. If a suspected Sensor is not incrementing, incrementing very slowly compared to others or not at all, that could be a result of interference from aftermarket devices. The sensor transmission success rate (the rate at which each sensors transmission is being received by the RCDLR) can be verified in the scan tool.

NOTE: Scan tool procedure will be used if Tire Pressure Sensor exhibits "no Signal or poor intermittent signal reception" Before proceeding, check for the following:

Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.

- A sensor does not transmit or transmits invalid data to the RCDLR.
- A sensor might exhibit low battery condition.
- If equipped, the driver information center displays " dashes" for the suspected sensor.
- Aftermarket wheel valve system locations can cause a sensor to not function correctly.
- A sensor may have been damaged due to a previous wheel/tire service or flat tire event.
- The use of other than GM approved tire sealants can obstruct the sensor pressure sensing port and cause inaccurate tire pressure readings. If this condition is verified, remove the sealer from the tire and replace the

sensor. Refer to [Tire Pressure Indicator Sensor Replacement](#)

- Occasionally sensor transmissions are not received by the RCDLR due to vehicle level radio frequency interference from items such as but not limited to aftermarket ignition systems, DVD players, CB radios, or metallic type window tinting

How to determine if Sensor Signal is poor or has no signal

Use Scan Tool and follow on screen instructions:

1. Select Module Diagnosis
2. Select Body Control Module
3. Select Configuration/Reset Functions
4. Select Tire Pressure Sensor Signal Reset
5. The Tire Pressure Sensor Rolling Count parameters will be displayed

If the Tire Pressure Sensor Rolling Count parameter is below 50% on one or more tires

NOTE: When moving the tire pressure sensor to a different location on the vehicle, keep the tire pressure sensor with the original tire it is installed in.

- Move the appropriate tire to a different location on the vehicle and verify the Tire Pressure Sensor Rolling Count has increased. Refer to [Tire and Wheel Removal and Installation](#) .
- If Tire Pressure Sensor Rolling Count parameter does not increase after moving tire to different location, replace the appropriate B2 Tire Pressure Sensor and perform the [Tire Pressure Indicator Sensor Learn](#).
- If Tire Pressure Sensor Rolling Count parameter does increase after moving tire to different location, check for any aftermarket devices that could be causing interference to the tire pressure sensor signal. Unplug the device and re-run test.

If the Tire Pressure Sensor Rolling Count parameter is above 50% on one or more tires (Follow normal TPM troubleshooting in Service information)

1. Verify if all 4 tire monitor pressure sensor DTCs are not set.
2. If 2 or more tire monitor pressure sensor DTCs are set, test the keyless entry antenna for proper operation, or if antenna is properly seated. Refer to [Keyless Entry System Malfunction \(Active\)](#) [Keyless Entry System Malfunction \(Passive\)](#) .
3. Perform the [Tire Pressure Indicator Sensor Learn](#).
4. Verify the scan tool Tire Pressure Sensor Mode parameters change to Drive while driving the vehicle above 40 km/h (25 mph) for greater than 2 min.
5. If a Tire Pressure Sensor Mode parameter does not change to Drive.
6. Replace the appropriate B2 Tire Pressure Sensor.
7. Perform the [Tire Pressure Indicator Sensor Learn](#).
8. If the Tire Pressure Sensor Mode parameter changes to Drive.
9. All OK.

REPAIR INSTRUCTIONS

TIRE PRESSURE INDICATOR SENSOR REPLACEMENT

Removal Procedure

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#)
2. Remove the tire and wheel assembly. Refer to [Tire and Wheel Removal and Installation](#)
3. Dismount the tire from the rim. Refer to [Tire Dismounting and Mounting](#)

Fig. 1: Tire Pressure Indicator Sensor Components

Courtesy of GENERAL MOTORS COMPANY

NOTE: Never fit the tire pressure indicator sensor on unapproved wheel rims.

NOTE: Whenever the tire will be removed from the rim, install a new valve stem and a new bolt. Do not reuse the old parts.

4. Remove and DISCARD the bolt (1) from the tire pressure transmitter (2) and pull it straight off the tire pressure valve stem (3).

CAUTION: Do not scratch or damage the clear coating on aluminum wheels with the tire changing equipment. Scratching the clear coating could cause the aluminum wheel to corrode and the clear coating to peel from the wheel.

5. Remove and DISCARD the tire pressure valve stem by pulling it through the rim.

Installation Procedure

Fig. 2: Tire Pressure Indicator Sensor Components

Courtesy of GENERAL MOTORS COMPANY

NOTE:

- Ensure the flat of the valve lines up with the flats of the snap in the enclosure.
- Valve stems and bolts are single use items.

1. Assemble the tire pressure transmitter (2) to the NEW valve stem (1) and install the NEW bolt (3).

Fig. 3: Anti Rotation Pin

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Fastener Caution

2. Insert an anti rotation pin (1) through the cross-drilled hole in the valve stem and tighten the bolt to 1.4 N.m (12.4 lb in).

NOTE: When mounting the tires, use an approved tire mounting lubricant.

3. Apply tire soap to the rubber portion of the valve stem (2).

Fig. 4: Pull Valve Stem Through Rim Using Special Tool

Courtesy of GENERAL MOTORS COMPANY

4. Using a tire valve stem mounting tool, pull the valve stem through in a direction parallel to the valve hole on the rim.

Fig. 5: Proper Valve Stem Seating

Courtesy of GENERAL MOTORS COMPANY

5. Check the valve stem (1) for correct seat on the rim (2).
 - The rim hole edge has to be completely in the notch of the valve stem.
 - The valve and the rim hole have to be concentric.

Fig. 6: Tire Pressure Transmitter To Valve Stem Gap

Courtesy of GENERAL MOTORS COMPANY

6. Make sure that there is a gap between the valve stem (1) and the tire pressure transmitter (2).

NOTE: The tire should not have contact with the tire pressure indicator sensor during installation to prevent a damage of the tire pressure indicator sensor.

7. Mount the tire to the rim. Refer to [Tire Dismounting and Mounting](#)
8. Inflate the tire to the specified pressure as stated on the tire placard.
9. Install the NEW dust cap.
10. Balance the tire and wheel assembly.
11. Install the tire and wheel assembly. Refer to [Tire and Wheel Removal and Installation](#)
12. Learn the tire pressure indicator sensor. Refer to [Tire Pressure Indicator Sensor Learn](#).
13. Lower the vehicle.

TIRE PRESSURE INDICATOR SENSOR LEARN

Special Tools

- **EL-46079** Tire Pressure Monitor Diagnostic Tool
- **EL-50448** Tire Pressure Monitor Sensor Activation Tool

For equivalent regional tools, refer to [Special Tools \(UJM\)](#).

Learn Mode Description

The tire pressure monitor system uses the instrument cluster, body control module (BCM), 4 radio frequency transmitting pressure sensors, remote control door lock receiver (RCDLR) and the serial data circuit to perform the tire pressure monitor learn mode functions. The sensor learn procedure must be performed after every tire rotation, BCM replacement, or sensor replacement. Once the Learn mode has been enabled, each of the sensors unique identification codes can be learned into the BCM memory. When a sensor ID has been learned, the BCM sounds a horn chirp indicating the sensor has transmitted its ID and the BCM has received and learned it. The BCM must learn the sensor IDs in the proper sequence to determine correct sensor location. The first learned ID is assigned to the left front location, the second to right front, the third to right rear and the fourth to left rear. The turn signals will

individually illuminate indicating which location is to be learned in the proper sequence.

Sensor Functions Using EL-46079, EL-50448, or Equivalent

Each sensor has an internal low frequency coil. When the tire pressure monitor special tool is used in activate mode, it produces a low frequency transmission that activates the sensor. The sensor responds to a low frequency activation by transmitting in Learn Mode-Remotely Triggered. When the BCM receives a learn mode transmission while in Learn mode, it will assign that sensors ID to the location on the vehicle relative to the order in which it was learned.

Learn Mode Cancellation

The Learn mode will cancel if the ignition is cycled to OFF or if more than 2 minutes has elapsed for any sensor or 5 min overall has elapsed to match all four sensors. If the relearn mode is cancelled before the first sensor is learned, the original sensor IDs will be maintained. If the relearn mode is canceled after the first sensor is learned, the following will occur:

- All stored sensor IDs will be invalidated in the BCM memory.
- If equipped, the driver information center will display dashes instead of tire pressures.
- DTC C0775 will be set.

These conditions will now require the Learn procedure to be repeated for the system to function properly.

Tire Pressure Monitor Learn Procedure

NOTE: In the event a particular sensor is activated and the horn does not chirp, it may be necessary to rotate the wheel so that the valve stem is in a different position due to the sensor signal is being blocked by another component. Make sure the TPM tool battery is sufficient to complete TPM learn process. Do not place the TPM tool directly on the valve stem. The TPM tool should be placed against the tire sidewall near the valve stem. The TPM sensor learn activation procedure may have to be repeated up to 3 times before determining a sensor is malfunctioning.

1. Apply park brake (manual transmission only).
2. Ignition On/Vehicle in Service Mode, using a scan tool or driver information center buttons (refer to owners manual), initiate the Tire Pressure Sensors Learn mode. A double horn chirp will sound indicating the Learn mode has been enabled. The left front turn signal will also be illuminated.
3. Starting with the left front tire, active the sensor by holding the antenna of the tire pressure monitor special tool aimed upward against the tire sidewall close to the wheel rim at the valve stem location. Press and release the activate button. Ensure that the transmit indicator on the special tool indicates that the sensor activation signal is being transmitted. Wait for a horn chirp. If the horn does not chirp, repeat the sensor activation sequence with the tool. Once the horn chirp has sounded, the sensor information is learned and the turn signal in the next location to be learned will illuminate.
4. After the horn chirp has sounded and the right front turn signal is illuminated, repeat step 3 for the remaining 3 sensors in the following order:
 1. Right front
 2. Right rear
 3. Left rear
5. When the left rear sensor has been learned and a double horn chirp has sounded, the learn process is complete and the BCM exits the Learn mode.

DESCRIPTION AND OPERATION

Special Tools

- **EL-46079/J-46079** Tire Pressure Monitor Diagnostic Tool
- **EL-50448** Tire Pressure Monitor Sensor Activation Tool

For equivalent regional tools, refer to [Special Tools \(UJM\)](#).

The tire pressure monitor system warns the driver when a significant loss of tire pressure occurs in any of the 4 tires and allows the driver to display the individual tire pressures and their locations on the driver information center.

The system uses the body control module (BCM), driver information center, instrument cluster, remote control door lock receiver (RCDLR), and a radio frequency (RF) transmitting pressure sensor in each wheel/tire assembly, and the serial data circuit to perform the system functions. Each sensor has an internal power supply with an approximate 10 year service life.

When the vehicle is stationary, the sensor's internal accelerometer is inactive, which puts the sensors into a Stationary state. In this state the sensors sample tire pressure once every 30 seconds and do not transmit at all if the tire pressure does not change. As vehicle speed increases, centrifugal force activates the sensors internal accelerometer causing the sensors to go into Wake and then Drive mode. In Drive mode, the sensors sample tire pressure once every 30 seconds and transmit in Drive mode once every 60 seconds. The RCDLR receives and translates the data contained in each sensors RF transmission into sensor presence, sensor mode, and tire pressure and passes it to the BCM. In turn, the BCM sends the tire pressure and tire location data to the driver information center via the serial data circuit where they are displayed.

The sensors continuously compare their last pressure sample to their current pressure sample and will transmit in Learn Mode-Pressure Triggered if a 8.3 kPa (1.2 psi) change in tire pressure has been detected in either a Stationary or Drive state. When the tire pressure monitor system detects a significant loss of tire pressure, the tire pressure monitor indicator icon is illuminated on the instrument cluster and if equipped, a tire pressure low, add air to tire type message is displayed on the driver information center. Both the indicator icon and driver information center message can be cleared by adjusting the tire pressures to the recommended pressures and driving the vehicle above 40 km/h (25 mph) for at least 2 minutes.

If power is disconnected from the BCM or if the vehicle battery is disconnected, each tire pressure monitor sensor ID is retained but all of the tire pressure information is lost. Under these circumstances the BCM cannot assume that the tire pressures were maintained over an unknown period of time. If equipped, the driver information center will display all dashes and the scan tool will indicate a default tire pressure value of 1020 kPa (148 psi) for each tire. Driving the vehicle above 40 km/h (25 mph) for at least 2 minutes will activate the sensors causing the driver information center to display the current tire pressures. The **EL-46079/J-46079** tire pressure monitor diagnostic tool, **EL-50448** tire pressure monitor sensor activation tool, or equivalent may also be used to activate the sensors as well.

The BCM has the ability to detect malfunctions within the tire pressure monitor system. In the event a DTC is set, the tire pressure monitor indicator icon on the instrument cluster, if equipped will flash for 1 minute and then remain illuminated after the ignition is turned ON and the instrument cluster bulb check has been completed. Any malfunction detected will cause the driver information center to display a service tire monitor system type message. For more information on other functions of the BCM, refer to [Keyless Entry System Description and Operation](#) .

6. All OK.

Circuit/System Testing

NOTE: It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.

1. Ignition/Vehicle & All vehicle systems - Off

2. Disconnect the appropriate electrical connector: A24D Door Handle Assembly - Driver Exterior or A24P Door Handle Assembly - Passenger Exterior

3. Test for less than 10 ohms between the test points: Ground circuit terminal 5 & Ground

- **If 10 ohms or greater**

1. Disconnect Ground Connection

2. Test for less than 2 ohms between the test points: Ground circuit terminal 5 @ Component harness & Ground Connection

- If 2 ohms or greater - Repair the open/high resistance in the circuit.
- If less than 2 ohms - Repair the open/high resistance in the ground connection.

- **If less than 10 ohms**

4. Ignition - On/Vehicle - In Service Mode

5. Verify the scan tool parameter: Exterior Door Handle Switch Circuit = Inactive
 - **If not the specified state**
 1. Ignition/Vehicle - Off
 2. Disconnect the electrical connector: K84 Keyless Entry Control Module
 3. Test for infinite resistance between the test points: Signal circuit terminal 1 @ Component harness & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance - Replace the component: K84 Keyless Entry Control Module
 - **If the specified state**
6. Connect a 3 A fused jumper wire between the test points: Signal circuit terminal 1 & Ground circuit terminal 5
7. Verify the scan tool parameter: Exterior Door Handle Switch Circuit = Active
 - **If not the specified state**
 1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
 2. Disconnect the electrical connector: K84 Keyless Entry Control Module
 3. Ignition - On/Vehicle - In Service Mode
 4. Test for less than 1 V between the test points: Signal circuit terminal 1 @ Component harness & Ground
 - If 1 V or greater - Repair the short to voltage on the circuit.
 - If less than 1 V
 - 5. Ignition/Vehicle - Off
 - 6. Test for less than 2 ohms between the test points:
 - Signal circuit terminal 1 @ A24D Door Handle Assembly - Driver Exterior & Terminal 12 X2 @ Control module harness
 - Signal circuit terminal 1 @ A24P Door Handle Assembly - Passenger Exterior & Terminal 11 X2 @ Control module harness
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Replace the component: K84 Keyless Entry Control Module
 - **If the specified state**
8. Test or replace the component: A24 Door Handle Assembly

Component Testing

1. Ignition/Vehicle - Off
2. Disconnect the appropriate electrical connector: A24D Door Handle Assembly - Driver Exterior or A24P Door Handle Assembly - Passenger Exterior
3. Test for infinite resistance between the test points: Signal terminal 1 & Ground terminal 5 - Not Pressed
 - **If less than infinite resistance**

Replace the component: A24 Door Handle Assembly
 - **If infinite resistance**

4. Test for less than 3 ohms between the test points: Signal terminal 1 & Ground terminal 5 - Pressed

- **If 3 ohms or greater**

Replace the component: A24 Door Handle Assembly

- **If less than 3 ohms**

5. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: [Diagnostic Repair Verification](#)

- Refer to [Front Side Door Outside Handle Replacement \(Base\)](#)[Front Side Door Outside Handle Replacement \(Pass Key Entry ATH\)](#)
- For control module replacement, programming, and setup refer to: [Control Module References](#)

DTC B1534 OR B1535: LEFT/RIGHT REAR DOOR HANDLE SWITCH CIRCUIT SHORT TO GROUND

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC B1534

Left Rear Door Handle Switch Circuit

DTC B1535

Right Rear Door Handle Switch Circuit

Symptom Byte Information: [Symptom Byte List](#)

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal - B27LR Door Handle Switch - Left Rear Exterior	B1534 02	1	1	-
Signal - B27RR Door Handle Switch - Right Rear Exterior	B1535 02	2	2	-
Ground - B27LR Door Handle Switch - Left Rear Exterior	-	1	-	-

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ground - B27RR Door Handle Switch - Right Rear Exterior	-	2	-	-
1. B27LR Door Handle Switch - Left Rear Exterior = Disabled 2. B27RR Door Handle Switch - Right Rear Exterior = Disabled				

Circuit/System Description

For an overview of the component/system, refer to: [Power Door Locks Description and Operation](#)

Circuit	Description
Signal	The control module input circuit has an internal resistance connected to 12 V.
Ground	Chassis Ground

Component	Description
B27LR Door Handle Switch - Left Rear Exterior	The switch has a normally open contact. When the switch is activated, the signal circuit to the control module is grounded.
B27RR Door Handle Switch - Right Rear Exterior	The switch has a normally open contact. When the switch is activated, the signal circuit to the control module is grounded.
K84 Keyless Entry Control Module	The control module also reads various switches and sensors and makes their values available via serial data.

Conditions for Running the DTC

Ignition/Vehicle = On

Conditions for Setting the DTC

B1534 02

Control module K84 detects: Signal @ B27LR Door Handle Switch - Left Rear Exterior = Short to Ground - For greater than 60 s

B1535 02

Control module K84 detects: Signal @ B27RR Door Handle Switch - Right Rear Exterior = Short to Ground - For greater than 60 s

Actions Taken When the DTC Sets

B1534 02

B27LR Door Handle Switch - Left Rear Exterior = Disabled

B1535 02

B27RR Door Handle Switch - Right Rear Exterior = Disabled

Conditions for Clearing the DTC

- A current DTC will clear when the diagnostic runs and passes.
- A history DTC will clear after 50 consecutive malfunction-free ignition cycles.

Circuit/System Verification

1. Ignition - On/Vehicle - In Service Mode
2. Verify the scan tool parameter: Exterior Left Rear Door Handle Switch = Inactive
 - **If not the specified state**

Refer to: Circuit/System Testing
 - **If the specified state**
3. Verify the scan tool parameter: Exterior Right Rear Door Handle Switch = Inactive
 - **If not the specified state**

Refer to: Circuit/System Testing
 - **If the specified state**
4. Operate the component: B27LR Door Handle Switch - Left Rear Exterior - Pressed

Verify the scan tool parameter: Exterior Left Rear Door Handle Switch = Active

- **If not the specified state**

Refer to: Circuit/System Testing

- **If the specified state**

5. Operate the component: B27RR Door Handle Switch - Right Rear Exterior - Pressed

Verify the scan tool parameter: Exterior Right Rear Door Handle Switch = Active

- **If not the specified state**

Refer to: Circuit/System Testing

- **If the specified state**

6. All OK.

Circuit/System Testing

NOTE: It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.

1. Ignition/Vehicle & All vehicle systems - Off

2. Disconnect the appropriate electrical connector: A24LR Door Handle Assembly - Left Rear Exterior or A24RR Door Handle Assembly - Right Rear Exterior

3. Test for less than 10 ohms between the test points: Ground circuit terminal 5 & Ground

- **If 10 ohms or greater**

1. Disconnect Ground Connection

2. Test for less than 2 ohms between the test points: Ground circuit terminal 5 @ Component harness & Ground Connection

- If 2 ohms or greater - Repair the open/high resistance in the circuit.
- If less than 2 ohms - Repair the open/high resistance in the ground connection.

- **If less than 10 ohms**

4. Ignition - On/Vehicle - In Service Mode

5. Verify the scan tool parameter: Exterior Door Handle Switch Circuit = Inactive

- **If not the specified state**

1. Ignition/Vehicle - Off

2. Disconnect the electrical connector: X2 @ K84 Keyless Entry Control Module

3. Test for infinite resistance between the test points: Signal circuit terminal 1 @ Component harness & Ground

- If less than infinite resistance - Repair the short to ground on the circuit.
- If infinite resistance - Replace the component: K84 Keyless Entry Control Module

- **If the specified state**

6. Connect a 3 A fused jumper wire between the test points: Signal circuit terminal 1 & Ground circuit terminal 5
7. Verify the scan tool parameter: Exterior Door Handle Switch Circuit = Active
 - **If not the specified state**
 1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
 2. Disconnect the electrical connector: X2 @ K84 Keyless Entry Control Module
 3. Ignition On/Vehicle in Service Mode.
 4. Test for less than 1 V between the test points: Signal circuit terminal 1 @ Component harness & Ground
 - If 1 V or greater - Repair the short to voltage on the circuit.
 - If less than 1 V
 5. Ignition/Vehicle - Off
 6. Test for less than 2 ohms between the test points:
 - Signal circuit terminal 1 @ A24LR Door Handle Assembly - Left Rear Exterior & Terminal 2 X2 @ Control module harness
 - Signal circuit terminal 1 @ A24RR Door Handle Assembly - Right Rear Exterior & Terminal 1 X2 @ Control module harness
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Replace the component: K84 Keyless Entry Control Module
 - **If the specified state**
8. Test or replace the component: A24 Door Handle Assembly

Component Testing

1. Ignition/Vehicle - Off
2. Disconnect the appropriate electrical connector: A24LR Door Handle Assembly - Left Rear Exterior or A24RR Door Handle Assembly - Right Rear Exterior
3. Test for infinite resistance between the test points: Signal terminal 1 & Ground terminal 5 - Not Pressed
 - **If less than infinite resistance**

Replace the component: A24 Door Handle Assembly
 - **If infinite resistance**
4. Test for less than 3 ohms between the test points: Signal terminal 1 & Ground terminal 5 - Pressed
 - **If 3 ohms or greater**

Replace the component: A24 Door Handle Assembly
 - **If less than 3 ohms**
5. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: [Diagnostic Repair Verification](#)

- Refer to [Rear Side Door Outside Handle Replacement](#)
- For control module replacement, programming, and setup refer to: [Control Module References](#)

DTC B297B OR B297C: DRIVER DOOR OPEN SWITCH CIRCUIT NOT PLAUSIBLE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC B297B 5A

Driver Door Open Switch Circuit Not Plausible

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	B297B 5A	B297B 5A	B297B 5A	-
Ground	-	B297B 5A	-	-

Circuit/System Description

The keyless entry control module provides a 12 V signal to the driver door open switch signal circuit. The driver window motor provides a 12 V signal to the driver door ajar switch signal circuit. The door open switches and the door ajar switches are integral to the driver door latch assembly.

The door open switch and the door ajar switch contacts will be open with the door is fully closed, the door switches within the door latch are designed so that the when the door is ajar, the contact in the door ajar switch closes, the voltage is pulled low and the window motor will then send a serial data message to the body control module indicating that the door is ajar. When the door is opened further, the contact in the door open switch will then close providing a ground for the door open signal circuit, the keyless entry control module will then detect that the door is open.

Conditions for Running the DTC

Battery voltage is between 9 - 16 V.

Conditions for Setting the DTC

- The keyless entry control module detects the driver door open switch is Active while receiving a serial data message from the body control module that the driver door ajar switch is Inactive.
- The condition must be present for greater than 2 seconds

Action Taken When the DTC Sets

The keyless entry control module will not notify the driver if a transmitter remains in the vehicle after exiting

Conditions for Clearing the DTC

- The DTC will be current for as long as the fault is present.
- When the keyless entry control module receives a serial data message from the body control module that the door is ajar before the keyless entry control module detects the door open switch is active, then the DTC will be a history DTC.
- A history DTC will clear after 50 ignition cycles.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Body Control Module Driver Door Ajar Switch parameter changes between Inactive and Active when opening and closing the driver door.

- **If the parameter does not change**

Refer to [Door Ajar Indicator Malfunction](#)

- **If the parameter changes**

3. Verify the scan tool Keyless Entry Control Module Driver Door Ajar Switch parameter changes between Inactive and Active when opening and closing the driver door.

- **If the parameter does not change**

Refer to Circuit/System Testing

- **If the parameter changes**

4. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the A23D Door Latch Assembly-Driver. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 3 and ground.
 - **If 10 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify the scan tool Driver Door Ajar Switch parameter is Inactive.
 - **If not Inactive**
 1. Vehicle OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
 2. Test for infinite resistance between the signal circuit terminal 2 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K84 Keyless Entry Control Module.
 - **If Inactive**
5. Install a 3 A fused jumper wire between the circuit terminals 2 and ground.
6. Verify the scan tool Driver Door Ajar Switch parameter is Active.
 - **If not Active**
 1. Vehicle OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K84 Keyless Entry Control Module.
 - **If Active**
7. Test or replace the A23D Door Latch Assembly-Driver

Component Testing

1. Vehicle OFF, disconnect the harness connector at the A23D Door Latch Assembly-Driver.
2. Test for infinite resistance between the signal terminal 2 and the ground terminal 3 with the switch in the open position.

- **If less than infinite resistance**

Replace the A23D Door Latch Assembly-Driver.

- **If infinite resistance**

3. Test for less than 3 Ω between the signal terminal 2 and the ground terminal 3 with the switch in the closed position.

- **If 3 Ω or greater**

Replace the A23D Door Latch Assembly-Driver.

- **If less than 3 Ω**

4. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Front Side Door Latch Replacement](#)
- Refer to [Control Module References](#) for keyless entry control module replacement, programming and setup

DTC B3125, B3130, OR B3135: DRIVER DOOR ONLY UNLOCK CIRCUIT/ALL DOORS UNLOCK CIRCUIT/ALL DOORS LOCK CIRCUIT

Circuit/System Description

For an overview of the component/system, refer to: [Power Door Locks Description and Operation](#)

Circuit	Description
B+ - K9 Body Control Module	Supplied from a fuse.
Ground - K9 Body Control Module	Chassis Ground
Control - Driver Door Unlock	The output circuit is switched from ground to 12 V to activate the component.
Control - All Doors Lock	The output circuit is switched from ground to 12 V to activate the component.
Control - Passenger Door Unlock	The output circuit is switched from ground to 12 V to activate the component.

Component	Description
A23 Door Latch Assembly	The door locks are actuated by a bidirectional DC motor that locks/unlocks the door so that it can not be opened from outside the vehicle (but still from inside).
K9 Body Control Module	The module controls various vehicle functions like lighting, central door locking, power windows, etc. The control module also reads various switches and sensors

Component	Description
	and makes their values available via serial data.

Conditions for Running the DTC

Ignition - On/Vehicle - In Service Mode

Conditions for Setting the DTC

B3125 01, B3130 01, B3135 01

Control module K9 detects: A23 Door Latch Assembly - Control Circuit = Short to Battery

B3125 02, B3130 02 and B3135 02 Condition 1

Control module K9 detects: A23 Door Latch Assembly - Control Circuit = Short to Ground

B3125 02, B3130 02 and B3135 02 Condition 2

Control module K9 detects: B+ circuit terminal 4 X2 @ K9 Body Control Module = Open

B3125 02, B3130 02 and B3135 02 Condition 3

Control module K9 detects: B+ circuit terminal 4 X2 @ K9 Body Control Module = Short to Ground

Actions Taken When the DTC Sets

All Doors Lock Command & All Doors Unlock Command = Inoperative

Conditions for Clearing the DTC

- A current DTC will clear when the diagnostic runs and passes.
- A history DTC will clear after 50 consecutive malfunction-free ignition cycles.

Scan Tool Reference

[Control Module References](#)

[Circuit/System Verification](#)

1. Ignition - On/Vehicle - In Service Mode
2. Operate the component: S13D Door Lock Switch - Driver - Lock & Unlock

Verify the scan tool parameter: Driver Door Lock Switch = Inactive & Lock & Unlock

- **If not the specified state**

Refer to: [Power Door Locks Malfunction](#)

- **If the specified state**

3. Operate the component: S13D Door Lock Switch - Driver - Lock & Unlock

Verify the component works as specified:

- A23D Door Latch Assembly - Driver = Lock & Unlock
- A23LR Door Latch Assembly - Left Rear = Lock & Unlock
- A23P Door Latch Assembly - Passenger = Lock & Unlock
- A23RR Door Latch Assembly - Right Rear = Lock & Unlock
- **If the component does not activate - A23D Door Latch Assembly - Driver**

Refer to: Circuit/System Testing - Test 1

- **If the component does not activate - A23LR Door Latch Assembly - Left Rear**

Refer to: Circuit/System Testing - Test 2

- **If the component does not activate - A23P Door Latch Assembly - Passenger**

Refer to: Circuit/System Testing - Test 2

- **If the component does not activate - A23RR Door Latch Assembly - Right Rear**

Refer to: Circuit/System Testing - Test 2

- **If none of the components operate**

Refer to: Circuit/System Testing - Test 3

- **If all functions work properly**

4. All OK.

Circuit/System Testing

Test 1

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the electrical connector: A23D Door Latch Assembly - Driver
3. Connect a test lamp between the test points: Control terminal 7 & Control terminal 8
4. Ignition - On/Vehicle - In Service Mode
5. Operate the component: S13D Door Lock Switch - Driver - Lock & Unlock
6. Verify the test lamp does not turn On and Off.

- **If the test lamp turns On and Off**

Test or replace the component: A23D Door Latch Assembly - Driver

- **If the test lamp does not turn On and Off**

7. Ignition/Vehicle - Off
8. Disconnect the electrical connector: X6 @ K9 Body Control Module
9. Test for less than 2 ohms between the test points:
 - Control circuit terminal 7 @ A23D Door Latch Assembly - Driver & Terminal 1 X6 @ Control module harness
 - Control circuit terminal 8 @ A23D Door Latch Assembly - Driver & Terminal 4 X6 @ Control module harness
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - **If less than 2 ohms**
10. Test or replace the component: K9 Body Control Module

Test 2

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the appropriate electrical connector:
 - A23LR Door Latch Assembly - Left Rear
 - A23P Door Latch Assembly - Passenger
 - A23RR Door Latch Assembly - Right Rear
3. Connect a test lamp between the test points:
 - A23P Door Latch Assembly - Passenger Control terminal 8 & Control terminal 9
 - A23LR Door Latch Assembly - Left Rear Control terminal 7 & Control terminal 8
 - A23RR Door Latch Assembly - Right Rear Control terminal 8 & Control terminal 9
4. Ignition - On/Vehicle - In Service Mode
5. Operate the component: S13D Door Lock Switch - Driver - Lock & Unlock
6. Verify the test lamp does not turn On and Off.

- **If the test lamp turns On and Off**

Test or replace the component: A23 Door Latch Assembly

- **If the test lamp does not turn On and Off**

7. Ignition/Vehicle - Off
8. Disconnect the electrical connector: X6 @ K9 Body Control Module
9. Ignition - On/Vehicle - In Service Mode
10. Test for less than 2 ohms between the test points:
 - Control circuit terminal 7 @ A23LR Door Latch Assembly - Left Rear & Terminal 2 X6 @ Control module harness
 - Control circuit terminal 8 @ A23LR Door Latch Assembly - Left Rear & Terminal 4 X6 @ Control module harness
 - Control circuit terminal 8 @ A23P Door Latch Assembly - Passenger & Terminal 4 X6 @ Control module harness
 - Control circuit terminal 9 @ A23P Door Latch Assembly - Passenger & Terminal 2 X6 @ Control module harness
 - Control circuit terminal 8 @ A23RR Door Latch Assembly - Right Rear & Terminal 4 X6 @ Control module harness
 - Control circuit terminal 9 @ A23RR Door Latch Assembly - Right Rear & Terminal 2 X6 @ Control module harness
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - **If less than 2 ohms**
11. Test or replace the component: K9 Body Control Module

Test 3

NOTE: It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the electrical connector: X2 & X6 @ K9 Body Control Module
3. Test for less than 10 ohms between the test points: Ground circuit terminal 3 X6 & Ground
 - **If 10 ohms or greater**
 1. Disconnect Ground Connection
 2. Test for less than 2 ohms between the test points: Ground circuit terminal 3 X6 & Ground Connection
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
4. Ignition - On/Vehicle - In Service Mode
5. Verify a test lamp turns On between the test points: B+ circuit terminal 4 X2 & Ground

- **If the test lamp does not turn On and the circuit fuse is OK**

1. Ignition/Vehicle - Off & Remove - Test lamp
2. Test for less than 2 ohms between the test points: B+ circuit terminal 4 X2 & Output terminal @ Fuse
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Verify the fuse is OK and there is voltage at the fuse.

- **If the test lamp does not turn On and the circuit fuse is open**

1. Ignition/Vehicle - Off & Remove - Test lamp
2. Disconnect the electrical connector:
 - A23D Door Latch Assembly - Driver
 - A23LR Door Latch Assembly - Left Rear
 - A23P Door Latch Assembly - Passenger
 - A23RR Door Latch Assembly - Right Rear
3. Test for infinite resistance between the test points:
 - Control circuit terminal 1 X6 @ K9 Body Control Module & Ground
 - Control circuit terminal 2 X6 @ K9 Body Control Module & Ground
 - Control circuit terminal 4 X6 @ K9 Body Control Module & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance - Replace the component: A23 Door Latch Assembly

- **If the test lamp turns On**

6. Ignition/Vehicle - Off
 7. Connect the electrical connector: X2 @ K9 Body Control Module
 8. Ignition - On/Vehicle - In Service Mode
 9. Test for less than 1 V between the test points:
 - Control circuit terminal 1 X6 @ K9 Body Control Module & Ground
 - Control circuit terminal 2 X6 @ K9 Body Control Module & Ground
 - Control circuit terminal 4 X6 @ K9 Body Control Module & Ground
- **If greater than 1 V**

Repair the short to voltage on the circuit.

- **If 1 V or less**

10. Ignition/Vehicle - Off
 11. Test for infinite resistance between the test points:
 - Control circuit terminal 1 X6 @ K9 Body Control Module & Ground
 - Control circuit terminal 2 X6 @ K9 Body Control Module & Ground
 - Control circuit terminal 4 X6 @ K9 Body Control Module & Ground
- **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

12. Replace the component: K9 Body Control Module

Component Testing

1. Ignition/Vehicle - Off
2. Disconnect the appropriate electrical connector:
 - A23D Door Latch Assembly - Driver
 - A23P Door Latch Assembly - Passenger
 - A23LR Door Latch Assembly - Left Rear
 - A23RR Door Latch Assembly - Right Rear
3. Connect a 25 A fused jumper wire between the test points:
 - A23D Door Latch Assembly - Driver Control terminal 7 & B+
 - A23P Door Latch Assembly - Passenger Control terminal 8 & B+
 - A23LR Door Latch Assembly - Left Rear Control terminal 7 & B+
 - A23RR Door Latch Assembly - Right Rear Control terminal 8 & B+

CAUTION: Complete the testing as quickly as possible in order to prevent overheating and damaging the component.

4. Momentarily connect a jumper wire between the test points:
 - A23D Door Latch Assembly - Driver Control terminal 8 & Ground
 - A23P Door Latch Assembly - Passenger Control terminal 9 & Ground
 - A23LR Door Latch Assembly - Left Rear Control terminal 8 & Ground
 - A23RR Door Latch Assembly - Right Rear Control terminal 9 & Ground
5. Reverse the jumper wires 2 times between the terminals.

Verify the component works as specified: A23 Door Latch Assembly = Lock & Unlock

- **If not the specified state**

Replace the component: A23 Door Latch Assembly

- **If the specified state**

6. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: [Diagnostic Repair Verification](#)

- Refer to [Front Side Door Latch Replacement](#)
- Refer to [Rear Side Door Latch Replacement](#)

DTC B3150 00

Driver Door Lock Switch Circuit

DTC B3155 00

Passenger Door Lock Switch Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal terminal 2 @ S13D Door Lock Switch - Driver	B3150 00	2	2	-
Signal terminal 3 @ S13D Door Lock Switch - Driver	B3140 00	3	3	-
Signal terminal 2 @ S13P Door Lock Switch - Passenger	B3155 00	4	4	-
Signal terminal 3 @ S13P Door Lock Switch - Passenger	B3145 00	5	5	-
Ground - S13D Door Lock Switch - Driver	-	1	-	-
Ground - S13P Door Lock Switch - Passenger	-	6	-	-
1. S13D Door Lock Switch - Driver = Inoperative 2. Driver Door Lock Switch = Inoperative 3. Driver Door Unlock Switch = Inoperative 4. Passenger Door Lock Switch = Inoperative 5. Passenger Door Unlock Switch = Inoperative				

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
6. S13P Door Lock Switch - Passenger = Inoperative				

Circuit/System Description

For an overview of the component/system, refer to: [Power Door Locks Description and Operation](#)

Circuit	Description
Signal	The control module input circuit has an internal resistance connected to 12 V.
Ground	Chassis Ground

Component	Description
S13D Door Lock Switch - Driver	The switch has a normally open contact. When the switch is activated, the signal circuit to the control module is grounded.
S13P Door Lock Switch - Passenger	The switch has a normally open contact. When the switch is activated, the signal circuit to the control module is grounded.
K9 Body Control Module	The module controls various vehicle functions like lighting, central door locking, power windows, etc.

Conditions for Running the DTC

Ignition/Vehicle = On

Conditions for Setting the DTC

B3140 00

Control module K9 detects: Driver Door Lock Switch Circuit = Short to Ground - For greater than 60 s

B3145 00

Control module K9 detects: Passenger Door Unlock Switch Circuit = Short to Ground - For greater than 60 s

B3150 00

Control module K9 detects: Driver Door Unlock Switch Circuit = Short to Ground - For greater than 60 s

B3155 00

Control module K9 detects: Passenger Door Lock Switch Circuit = Short to Ground - For greater than 60 s

Actions Taken When the DTC Sets

B3140 00

Driver Door Lock Switch = Disabled

B3145 00

Passenger Door Unlock Switch = Disabled

B3150 00

Driver Door Unlock Switch = Disabled

B3155 00

Passenger Door Lock Switch = Disabled

Conditions for Clearing the DTC

- A current DTC will clear when the diagnostic runs and passes.
- A history DTC will clear after 50 consecutive malfunction-free ignition cycles.

Scan Tool Reference

Control Module References

Circuit/System Verification

1. Ignition - On/Vehicle - In Service Mode
2. Verify the scan tool parameter: Driver Door Lock Switch = Inactive
 - **If not the specified state**

Refer to: Circuit/System Testing - Test 1

- **If the specified state**

3. Operate the component: S13D Door Lock Switch - Driver - Lock & Unlock

Verify the scan tool parameter: Driver Door Lock Switch = Lock & Unlock

- **If not the specified state**

Refer to: Circuit/System Testing - Test 1

- **If the specified state**

4. Verify the scan tool parameter: Passenger Door Lock Switch = Inactive

- **If not the specified state**

Refer to: Circuit/System Testing - Test 2

- **If the specified state**

5. Operate the component: S13P Door Lock Switch - Passenger - Lock & Unlock

Verify the scan tool parameter: Passenger Door Lock Switch = Lock & Unlock

- **If not the specified state**

Refer to: Circuit/System Testing - Test 2

- **If the specified state**

6. All OK.

Circuit/System Testing

Test 1

NOTE: It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.

1. Ignition/Vehicle & All vehicle systems - Off

2. Disconnect the electrical connector: S13D Door Lock Switch - Driver

3. Test for less than 10 ohms between the test points: Ground circuit terminal 4 & Ground

- **If 10 ohms or greater**

1. Disconnect Ground Connection

2. Test for less than 2 ohms between the test points: Ground circuit terminal 4 @ Component harness & Ground Connection

- If 2 ohms or greater - Repair the open/high resistance in the circuit.
- If less than 2 ohms - Repair the open/high resistance in the ground connection.

- **If less than 10 ohms**

4. Ignition - On/Vehicle - In Service Mode

5. Verify the scan tool parameter: Driver Door Lock Switch = Inactive

- **If not the specified state**

1. Ignition/Vehicle - Off
2. Disconnect the electrical connector: X2 @ K9 Body Control Module
3. Test for infinite resistance between the test points:
 - Signal circuit terminal 2 @ Component harness & Ground
 - Signal circuit terminal 3 @ Component harness & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance - Replace the component: K9 Body Control Module

- **If the specified state**

6. Connect a 3 A fused jumper wire between the test points: Signal circuit terminal 2 & Ground circuit terminal 4
7. Verify the scan tool parameter: Driver Door Lock Switch = Lock

- **If not the specified state**

1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
2. Disconnect the electrical connector: X2 @ K9 Body Control Module
3. Ignition - On/Vehicle - In Service Mode
4. Test for less than 1 V between the test points: Signal circuit terminal 2 @ Component harness & Ground
 - If 1 V or greater - Repair the short to voltage on the circuit.
 - If less than 1 V
5. Ignition/Vehicle - Off
6. Test for less than 2 ohms between the test points: Signal circuit terminal 2 @ Component harness & Terminal 19 X2 @ Control module harness
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Replace the component: K9 Body Control Module

- **If the specified state**

8. Connect a 3 A fused jumper wire between the test points: Signal circuit terminal 3 & Ground circuit terminal 4
9. Verify the scan tool parameter: Driver Door Lock Switch = Unlock

- **If not the specified state**

1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
2. Disconnect the electrical connector: X2 @ K9 Body Control Module
3. Ignition - On/Vehicle - In Service Mode
4. Test for less than 1 V between the test points: Signal circuit terminal 3 @ Component harness & Ground
 - If 1 V or greater - Repair the short to voltage on the circuit.
 - If less than 1 V
5. Ignition/Vehicle - Off
6. Test for less than 2 ohms between the test points: Signal circuit terminal 3 @ Component harness &

Terminal 15 X2 @ Control module harness

- If 2 ohms or greater - Repair the open/high resistance in the circuit.
- If less than 2 ohms - Replace the component: K9 Body Control Module

- **If the specified state**

10. Test or replace the component: S13D Door Lock Switch - Driver

Test 2

NOTE: It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the electrical connector: S13P Door Lock Switch - Passenger
3. Test for less than 10 ohms between the test points: Ground circuit terminal 4 & Ground
 - **If 10 ohms or greater**
 1. Disconnect Ground Connection
 2. Test for less than 2 ohms between the test points: Ground circuit terminal 4 @ Component harness & Ground Connection
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
4. Ignition - On/Vehicle - In Service Mode
5. Verify the scan tool parameter: Passenger Door Lock Switch = Inactive
 - **If not the specified state**
 1. Ignition/Vehicle - Off
 2. Disconnect the electrical connector: X6 @ K9 Body Control Module
 3. Test for infinite resistance between the test points:
 - Signal circuit terminal 2 @ Component harness & Ground
 - Signal circuit terminal 3 @ Component harness & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance - Replace the component: K9 Body Control Module
 - **If the specified state**
6. Connect a 3 A fused jumper wire between the test points: Signal circuit terminal 2 & Ground circuit terminal 4
7. Verify the scan tool parameter: Passenger Door Lock Switch = Lock
 - **If not the specified state**
 1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
 2. Disconnect the electrical connector: X6 @ K9 Body Control Module
 3. Ignition - On/Vehicle - In Service Mode
 4. Test for less than 1 V between the test points: Signal circuit terminal 2 @ Component harness &

Ground

- If 1 V or greater - Repair the short to voltage on the circuit.
- If less than 1 V

5. Ignition/Vehicle - Off

6. Test for less than 2 ohms between the test points: Signal circuit terminal 2 @ Component harness & Terminal 13 X6 @ Control module harness

- If 2 ohms or greater - Repair the open/high resistance in the circuit.
- If less than 2 ohms - Replace the component: K9 Body Control Module

• **If the specified state**

8. Connect a 3 A fused jumper wire between the test points: Signal circuit terminal 3 & Ground circuit terminal 4

9. Verify the scan tool parameter: Passenger Door Lock Switch = Unlock

• **If not the specified state**

1. Ignition/Vehicle - Off & Remove - Jumper wire(s)

2. Disconnect the electrical connector: X6 @ K9 Body Control Module

3. Ignition - On/Vehicle - In Service Mode

4. Test for less than 1 V between the test points: Signal circuit terminal 3 @ Component harness & Ground

- If 1 V or greater - Repair the short to voltage on the circuit.
- If less than 1 V

5. Ignition/Vehicle - Off

6. Test for less than 2 ohms between the test points: Signal circuit terminal 3 @ Component harness & Terminal 6 X6 @ Control module harness

- If 2 ohms or greater - Repair the open/high resistance in the circuit.
- If less than 2 ohms - Replace the component: K9 Body Control Module

• **If the specified state**

10. Test or replace the component: S13P Door Lock Switch - Passenger

Component Testing

S13 Door Lock Switch - Test

1. Ignition/Vehicle - Off

2. Disconnect the appropriate electrical connector: S13 Door Lock Switch

3. Test for infinite resistance between the test points:

- Signal terminal 2 & Ground terminal 4 - Switch - Not Pressed
- Signal terminal 3 & Ground terminal 4 - Switch - Not Pressed
- **If less than infinite resistance**

Replace the component: S13 Door Lock Switch

- **If infinite resistance**

4. Test for less than 3 ohms between the test points: Signal terminal 2 & Ground terminal 4 - Lock Switch - Pressed
 - **If 3 ohms or greater**
 Replace the component: S13 Door Lock Switch
 - **If less than 3 ohms**
5. Test for less than 3 ohms between the test points: Signal terminal 3 & Ground terminal 4 - Unlock Switch - Pressed
 - **If 3 ohms or greater**
 Replace the component: S13 Door Lock Switch
 - **If less than 3 ohms**
6. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: [Diagnostic Repair Verification](#)

- Refer to [Door Lock Switch Replacement - Driver Side](#)
- Refer to [Door Lock Switch Replacement - Passenger Front](#)
- For control module replacement, programming, and setup refer to: [Control Module References](#)

DTC B3265: TRUNK LID UNLATCH OUTPUT CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC B3265

Trunk Lid Unlatch Output Circuit

Symptom Byte Information: [Symptom Byte List](#)

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control - Relay Coil	B3265 02	B3265 04	B3265 01	-
Ground - Relay Coil	-	B3265 04	-	-

Circuit/System Description

For an overview of the component/system, refer to: [Rear Hatch/Gate Description and Operation](#)

Circuit	Description
Control - Relay Coil	The output circuit is switched to 12 V to activate the component.
Ground - Relay Coil	Chassis Ground

Component	Description
KR95A Liftgate Unlatch Relay	A relay is a switch that is actuated by a solenoid.
K9 Body Control Module	The module controls various vehicle functions like lighting, central door locking, power windows, etc.

Conditions for Running the DTC

KR95A Liftgate Unlatch Relay - The component is commanded On.

Conditions for Setting the DTC

- B3265 01 - Control Circuit = Short to Battery
- B3265 02 - Control Circuit = Short to Ground
- B3265 04 - Control Circuit = Open

Actions Taken When the DTC Sets

A23C Liftgate Latch Assembly = Inoperative

Conditions for Clearing the DTC

- A current DTC will clear when the diagnostic runs and passes.
- A history DTC will clear after 50 consecutive malfunction-free ignition cycles.

Control Module References

Circuit/System Verification

1. Ignition - On/Vehicle - In Service Mode
2. Perform the scan tool control function: Rear Body Closure Unlatch - Unlatch

Verify the component produces a clicking sound: A23C Liftgate Latch Assembly

- **If the component does not produce a sound**

Refer to: Circuit/System Testing

- **If the component produces a sound**

3. All OK.

Circuit/System Testing

NOTE: It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.

1. Ignition/Vehicle & All vehicle systems - Off
2. Remove the component: KR95A Liftgate Unlatch Relay
3. Test for less than 10 ohms between the test points: Ground circuit terminal 86 & Ground
 - **If 10 ohms or greater**
 1. Disconnect Ground Connection
 2. Test for less than 2 ohms between the test points: Ground circuit terminal 86 & Ground Connection
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
4. Connect a test lamp between the test points: Control circuit terminal 85 & Ground circuit terminal 86
5. Ignition - On/Vehicle - In Service Mode
6. Perform the scan tool control function: Rear Body Closure Unlatch - Unlatch

Verify the test lamp turns On and Off.

- **If the test lamp is always Off**

1. Ignition/Vehicle - Off & Remove - Test lamp
2. Disconnect the electrical connector: K9 Body Control Module
3. Test for infinite resistance between the test points: Control circuit terminal 85 @ Relay Socket & Ground

- If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance
4. Test for less than 2 ohms between the test points: Control circuit terminal 85 @ Relay Socket & Terminal 11 X5 @ Control module harness
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Replace the component: K9 Body Control Module
 - **If the test lamp is always On**
 1. Ignition/Vehicle - Off & Remove - Test lamp
 2. Disconnect the electrical connector: K9 Body Control Module
 3. Ignition - On/Vehicle - In Service Mode
 4. Test for less than 1 V between the test points: Control circuit terminal 85 @ Relay Socket & Ground
 - If 1 V or greater - Repair the short to voltage on the circuit.
 - If less than 1 V - Replace the component: K9 Body Control Module
 - **If the test lamp turns On and Off**
7. Test or replace the component: KR95A Liftgate Unlatch Relay

Component Testing

Relay Test

1. Ignition/Vehicle - Off
2. Remove the component: KR95A Liftgate Unlatch Relay
3. Test for 70 to 110 ohms between the test points: Component terminal 85 & 86
 - **If not between 70 and 110 ohms**

Replace the component: KR95A Liftgate Unlatch Relay
 - **If between 70 and 110 ohms**
4. Test for infinite resistance between the test points:
 - Component terminal 30 & 85
 - Component terminal 30 & 86
 - Component terminal 30 & 87
 - Component terminal 85 & 87
 - **If less than infinite resistance**

Replace the component: KR95A Liftgate Unlatch Relay
 - **If infinite resistance**
5. Connect a 3 A fused jumper wire between the test points: Component terminal 86 & 12 V

Connect a jumper wire between the test points: Component terminal 85 & Ground
6. Test for less than 2 ohms between the test points: Component terminal 30 & 87

- If 2 ohms or greater

Replace the component: KR95A Liftgate Unlatch Relay

- If less than 2 ohms

7. All OK.

- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC B3618 00

Exterior Liftgate Window Unlatch Switch Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	B3618 00	1	1	-
Ground	-	1	-	-
1. S46 Liftgate Handle Switch = Disabled				

Circuit/System Description

For an overview of the component/system, refer to: [Rear Hatch/Gate Description and Operation](#)

Circuit	Description
Signal	The control module input circuit has an internal resistance connected to 12 V.
Ground	Chassis Ground

Component	Description
-----------	-------------

Component	Description
S46 Liftgate Handle Switch	• The switch has a normally open contact. • When the switch is activated, the signal circuit to the control module is grounded.
K9 Body Control Module	The module controls various vehicle functions like lighting, central door locking, power windows, etc.

Conditions for Running the DTC

Ignition - On/Vehicle - In Service Mode

Conditions for Setting the DTC

Signal Circuit = Short to Ground - For greater than 60 s

Actions Taken When the DTC Sets

S46 Liftgate Handle Switch = Disabled

Conditions for Clearing the DTC

- A current DTC will clear when the diagnostic runs and passes.
- A history DTC will clear after 50 consecutive malfunction-free ignition cycles.

Circuit/System Verification

1. Ignition - On/Vehicle - In Service Mode
2. Operate the component: S46 Liftgate Handle Switch - Pressed

Verify a click can be heard or felt at the component when it is turned On and Off: A23C Liftgate Latch Assembly

- **If a click cannot be heard or felt**

Refer to: Circuit/System Testing

- **If a click can be heard or felt**

3. All OK.

Circuit/System Testing

NOTE: It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the electrical connector: S46 Liftgate Handle Switch
3. Test for less than 10 ohms between the test points: Ground circuit terminal 2 & Ground
 - **If 10 ohms or greater**
 1. Disconnect Ground Connection
 2. Test for less than 2 ohms between the test points: Ground circuit terminal 2 @ Component harness & Ground Connection
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
4. Ignition - On/Vehicle - In Service Mode
5. Verify the component is not activated: A23C Liftgate Latch Assembly
 - **If not the specified state**
 1. Ignition/Vehicle - Off
 2. Disconnect the electrical connector: K9 Body Control Module
 3. Test for infinite resistance between the test points: Signal circuit terminal 1 @ Component harness & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance - Replace the component: K9 Body Control Module
 - **If the specified state**
6. Momentarily connect a 3 A fused jumper wire between the test points: Signal circuit terminal 1 & Ground circuit terminal 2
7. Verify the component produces a clicking sound: A23C Liftgate Latch Assembly
 - **If a click cannot be heard or felt**
 1. Ignition/Vehicle - Off & Remove - Jumper wire(s)

2. Disconnect the electrical connector: K9 Body Control Module
3. Ignition - On/Vehicle - In Service Mode
4. Test for less than 1 V between the test points: Signal circuit terminal 1 @ Component harness & Ground
 - If 1 V or greater - Repair the short to voltage on the circuit.
 - If less than 1 V
5. Ignition/Vehicle - Off
6. Test for less than 2 ohms between the test points: Signal circuit terminal 1 @ Component harness & Terminal 15 X6 @ Control module harness
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Replace the component: K9 Body Control Module
- **If a click can be heard or felt**
8. Test or replace the component: S46 Liftgate Handle Switch

Component Testing

1. Ignition/Vehicle - Off
2. Disconnect the electrical connector: S46 Liftgate Handle Switch
3. Test for infinite resistance between the test points: Signal terminal 1 & Ground terminal 2 - The switch is in the open position.
 - **If less than infinite resistance**

Replace the component: S46 Liftgate Handle Switch
 - **If infinite resistance**
4. Test for less than 3 ohms between the test points: Signal terminal 1 & Ground terminal 2 - The switch is in the closed position.
 - **If 3 ohms or greater**

Replace the component: S46 Liftgate Handle Switch
 - **If less than 3 ohms**
5. All OK.

Repair Instructions

DTC P0CCC, P0CCE, OR P0CCF: CHARGE PORT DOOR POSITION SENSOR CIRCUIT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.

- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC P0CCC 00

Charge Port Door Position Sensor Circuit

DTC P0CCE 00

Charge Port Door Position Sensor Circuit Low Voltage

DTC P0CCF 00

Charge Port Door Position Sensor Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open	High Resistance	Short to Voltage	Signal Performance
Signal	P0CCE 00	P0CCE 00	P0CCC 00	P0CCF 00	-
Ground	-	P0CCE 00	P0CCC 00	-	-

Circuit/System Description

The hybrid/EV powertrain control module 2 provides a 5V signal through a pull-up resistor to the charge port door position sensor circuit. The other end of the charge port door position sensor circuit is connected to the charge port door position switch. The hybrid/EV powertrain control module 2 monitors the voltage on the charge port door position sensor circuit. In normal operation, the hybrid/EV powertrain control module 2 sends a serial data message to the driver information center in the instrument panel cluster to display the Charge Door Open message.

Conditions for Running the DTC

Hybrid/EV powertrain control module 2 must be awake.

Conditions for Setting the DTC

P0CCC 00

The hybrid/EV powertrain control module 2 detects the charge port door position sensor signal circuit voltage is mid range between expected high and low voltage values

P0CCE 00

The hybrid/EV powertrain control module 2 detects a short to ground in the charge port position sensor circuit.

P0CCF 00

The hybrid/EV powertrain control module 2 detects a short to voltage or an open/high resistance in the charge port position sensor circuit.

Action Taken When the DTC Sets

The Charge Door Open message will not illuminate when the charge port door is open or ajar.

Conditions for Clearing the DTC

DTC P0CCC 00, P0CCE 00 and P0CCF 00 are type C DTCs

Description and Operation

Charge Port Door Description and Operation

Electrical Information Reference

- Circuit Testing
- Connector Repairs
- Testing for Intermittent Conditions and Poor Connections
- Wiring Repairs

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Charge Port Door parameter changes between Open and Closed when opening and closing the charge port door.
 - **If the parameter does not change**

Refer to Circuit/System Testing.
 - **If the parameter changes**
3. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the B197 Charge Port Door Position Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal C and ground.

- **If 10 Ω or greater**

1. Vehicle OFF.
2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 10 Ω**

3. Vehicle in Service Mode, test for 4.8 - 5.2 V between the 5 V reference circuit terminal A and ground.

- **If less than 4.8 V**

1. Vehicle OFF, disconnect the harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
2. Test for infinite resistance between the 5 V reference circuit and ground
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the 5 V reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If greater than 5.2 V**

1. Vehicle OFF, disconnect the harness connector at the K114B Hybrid/EV Powertrain Control Module 2, Vehicle in Service Mode.
2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If between 4.8 - 5.2 V**

4. Test or replace the B197 Charge Port Door Position Switch.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the B197 Charge Port Door Position Switch.
2. Test for 180 - 190 Ω between the signal terminal A and the ground terminal C with the switch in the open position.

- **If 191 Ω or greater**

Replace the B197 Charge Port Door Position Switch.

- **If 179 Ω or less**

Replace the B197 Charge Port Door Position Switch.

- **If 180 - 190 Ω**

3. Test for 2040 - 2065 Ω between the signal terminal A and the ground terminal C with the switch in the closed position.

- **If 2066 Ω or greater**

Replace the B197 Charge Port Door Position Switch.

- **If 2039 Ω or less**

Replace the B197 Charge Port Door Position Switch.

- **If 2040 - 2065 Ω**

4. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Charge Port Door Ajar Indicator Switch Replacement](#)
- Refer to [Control Module References](#) for the hybrid/EV powertrain control module 2 replacement, programming and setup

DTC P04B6: FUEL FILL DOOR STUCK CLOSED

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P04B6 00

Fuel Fill Door Stuck Closed

Circuit/System Description

The hybrid powertrain control module 2 monitors the voltage values of the fuel fill door open request wake-up signal circuit and the fuel door request signal circuit. When the refuel request switch is pressed, the two switch contacts close. This provides B+ to the Wake-up Circuit input of the hybrid powertrain control module 2 and lowers the voltage on the fuel door request signal circuit input to the hybrid powertrain control module 2. The hybrid powertrain control module 2 detects the voltage on the signal circuits and commands the fuel system to vent and sends a serial data message to the driver information center to display the Wait to Refuel message. The hybrid powertrain control module 2 then energizes the fuel door lock/unlock actuator to unlock the fuel door.

Conditions for Running the DTC

- The hybrid powertrain control module 2 is awake
- The fuel tank is being filled.

Conditions for Setting the DTC

The hybrid powertrain control module 2 has detected that the fuel level in the fuel tank has increased but detects that the fuel filler door was always in the closed position.

Action Taken When the DTC Sets

The driver information center will display the Service Refuel System message.

Conditions for Clearing the DTC

DTC P04B6 is a type B DTC.

DTC P04B8-P04BA: FUEL FILL DOOR POSITION SENSOR CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.

- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC P04B8 00

Fuel Fill Door Position Sensor Circuit

DTC P04B9 00

Fuel Fill Door Position Sensor Circuit Low Voltage

DTC P04BA 00

Fuel Fill Door Position Sensor Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open	High Resistance	Short to Voltage	Signal Performance
Signal	P04B9 00	P04B9 00	P04B8 00	P04BA 00	-
Ground	-	P04B9 00	P04B8 00	-	-

Circuit/System Description

The hybrid powertrain control module 2 provides a 5V signal through a pull-up resistor to the fuel door position sensor circuit. The other end of the fuel door position sensor circuit is connected to the fuel door position sensor in the fuel door status switch assembly. The hybrid powertrain control module 2 monitors the voltage on the fuel door position sensor circuit. In normal operation, when the Fuel Door moves to the open position, the switch in the fuel door lock position closes and lowers the voltage on the fuel door position sensor circuit.

Conditions for Running the DTC

Hybrid powertrain control module 2 is awake.

Conditions for Setting the DTC

P04B8 00

The hybrid powertrain control module 2 detects the fuel door position signal circuit voltage is mid range between expected high and low voltage values.

P04B9 00

The hybrid powertrain control module 2 detects a short to ground in the fuel door open signal circuit.

P04BA 00

The hybrid powertrain control module 2 detects a short to voltage or an open or high resistance in the fuel door open signal circuit.

Action Taken When the DTC Sets

The driver information center will continuously display the Wait To Refuel message after the refuel request switch is pressed.

Conditions for Clearing the DTC

DTC P04B8 00, P04B9 00 and P04BA 00 are type B DTCs

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Fuel Door Position parameter changes between Open and Closed when opening and closing the fuel filler door.
 - **If the parameter does not change**

Refer to Circuit/System Testing.
 - **If the parameter changes**
3. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the B208 Fuel Door Status Switch Assembly. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
 - **If 10 Ω or greater**

1. Vehicle OFF.
2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
3. Vehicle in Service Mode, test for 4.8 - 5.2 V between the 5 V reference circuit terminal 1 and ground.
 - **If less than 4.8 V**
 1. Vehicle OFF, disconnect the harness connector at the K114B Hybrid Powertrain Control Module 2.
 2. Test for infinite resistance between the 5 V reference circuit and ground
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the 5 V reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K114B Hybrid Powertrain Control Module 2.
 - **If greater than 5.2 V**
 1. Vehicle OFF, disconnect the harness connector at the K114B Hybrid Powertrain Control Module 2, Vehicle in Service Mode.
 2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K114B Hybrid Powertrain Control Module 2.
 - **If between 4.8 - 5.2 V**
4. Test or replace the B208 Fuel Door Status Switch Assembly.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the B208 Fuel Door Status Switch Assembly.
2. Test for 180 - 190 Ω between the signal terminal 1 and the ground terminal 2 with the switch in the open position.
 - **If 191 Ω or greater**

Replace the B208 Fuel Door Status Switch Assembly.
 - **If 179 Ω or less**

Replace the B208 Fuel Door Status Switch Assembly.
 - **If 180 - 190 Ω**
3. Test for 2040 - 2065 Ω between the signal terminal 1 and the ground terminal 2 with the switch in the closed position.
 - **If 2066 Ω or greater**

Replace the B208 Fuel Door Status Switch Assembly.

- If 2039 Ω or less

Replace the B208 Fuel Door Status Switch Assembly.

- If 2040 Ω - 2065 Ω

4. All OK

DTC Descriptors

DTC P04BB 00

Fuel Fill Door Lock Control Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Fuel Door Lock Actuator Lock Control	P04BB 00	P04BB 00	P04BB 00	-
Fuel Door Lock Actuator Unlock Control	P04BB 00	P04BB 00	P04BB 00	-

Circuit/System Description

The hybrid powertrain control module 2 monitors the voltage values of the fuel fill door open request wake-up signal circuit and the fuel door request signal circuit. When the refuel request switch is pressed, the two switch contacts close. This provide B+ to the Wake-up Circuit input of the hybrid powertrain control module 2 and lowers the voltage on the fuel door request signal circuit input to the hybrid powertrain control module 2. The hybrid powertrain control module 2 detects the voltage on the signal circuits and commands the fuel system to vent and sends a serial data message to the driver information center to display the Wait to Refuel message. The hybrid powertrain control module 2 then energizes the fuel door lock/unlock actuator to unlock the fuel door.

Conditions for Running the DTC

Hybrid Powertrain Control Module 2 is awake

Conditions for Setting the DTC

The hybrid powertrain control module 2 has detected a short to ground, short to voltage or an open/high resistance on either of the lock actuator control circuits

Action Taken When the DTC Sets

- The fuel door latch will malfunction and the fuel filler door may not be able to be opened.
- The Wait to Refuel message always be displayed on the driver information center.

Conditions for Clearing the DTC

DTC P04BB 00 is type B DTCs

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the function of the fuel door lock actuator when commanding the Fuel Fill Door to Lock and Unlock with a scan tool.
 - **If the Lock and Unlock function for the fuel door lock actuator does not work**
Refer to Circuit/System Testing.
 - **If the Lock and Unlock function for the fuel door lock actuator works**
3. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the M97 fuel door lock actuator.
2. Test for greater than 10 V between the control circuit terminal 1 and ground.
 - **If 10 V or less**
 1. Vehicle OFF, disconnect the harness connector at the K114B hybrid powertrain control module 2.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance on the circuit.
 - If less than 2 Ω , replace the K114B hybrid powertrain control module 2.
 - **If greater than 10 V**
3. Test for greater than 10 V between the control circuit terminal 2 and ground.
 - **If 10 V or less**
 1. Vehicle OFF, disconnect the harness connector at the K114B hybrid powertrain control module 2.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance on the circuit.
 - If less than 2 Ω , replace the K114B hybrid powertrain control module 2.
 - **If greater than 10 V**
4. Connect a test lamp between control circuit terminal 1 and control circuit terminal 2, Vehicle in Service Mode.
5. Verify the test lamp turns ON when commanding the Fuel Fill Door to Lock and Unlock with a scan tool.
 - **If the test lamp remains OFF during either of the commands**
 1. Vehicle OFF, disconnect the harness connector at the K114B hybrid powertrain control module 2. Vehicle in Service Mode
 2. Test for less than 1 V between each control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V replace the K114B hybrid powertrain control module 2
 - **If the test lamp turns ON during each of the commands**
6. Test or replace the M97 fuel door lock actuator.

Component Testing

Fuel Door Lock Actuator

1. Vehicle OFF, disconnect the harness connector at the M97 fuel door lock actuator.
2. Install a 25 A fused jumper wire between one of the control terminals and 12 V. Momentarily install a

jumper wire between the other control terminal and ground. Reverse the jumper wires at least two times, the M97 fuel door lock actuator should perform the LOCK and UNLOCK function.

- **If the actuator does not perform the LOCK and UNLOCK function**

Replace the M97 fuel door lock actuator.

- **If the actuator performs the LOCK and UNLOCK function**

3. All OK

Signal	P04CA 00	P04C8 00	P04C8 00	P04CB 00	-
Ground	-	P04C8 00	P04C8 00	P04CB 00	-

Circuit/System Description

The Hybrid/EV Powertrain Control Module 2 monitors the voltage values of the fuel fill door open request wake-up signal circuit and the fuel door request signal circuit. When the Refuel Request Switch is pressed, the

two switch contacts close. This provide B+ to the Wake-up Circuit input of the Hybrid/EV Powertrain Control Module 2 and changes the voltage level on the fuel door request signal circuit input to the Hybrid/EV Powertrain Control Module 2. The Hybrid/EV Powertrain Control Module 2 detects the voltage changes on the signal circuits and commands the fuel system to vent and sends a serial data message to the driver information center to display the Wait to Refuel message. The Hybrid/EV Powertrain Control Module 2 then energizes the fuel door lock/unlock actuator to unlock the fuel door.

Conditions for Running the DTC

The Hybrid/EV Powertrain Control Module 2 is awake

Conditions for Setting the DTC

P04C8 00

The Hybrid/EV Powertrain Control Module 2 the fuel fill door open request switch circuit voltage is mid-range between expected high and low voltage values.

P04CA 00

The Hybrid/EV Powertrain Control Module 2 detects a short to ground in the refuel request signal circuit.

P04CB 00

The Hybrid/EV Powertrain Control Module 2 detects a short to voltage or an open/high resistance in the refuel request signal circuit.

Action Taken When the DTC Sets

The Refuel Request Switch will still function normally.

Conditions for Clearing the DTC

DTC P04C8 00, P04CA 00 and P04CB 00 are type B DTCs

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the operation of the fuel filler door when commanding the fuel door lock actuator to UNLATCH by pressing the refuel request switch.

- **If the fuel door lock actuator does not UNLATCH**

Refer to Circuit/System Testing

- **If the fuel door lock actuator does UNLATCH**

3. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the S117 Refuel Request Switch. Vehicle in Service Mode.

2. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Vehicle OFF.

2. Test for less than 2 Ω in the B+ circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Vehicle OFF.

2. Test for infinite resistance between the B+ circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

4. Test for infinite resistance between the signal circuit terminal 2 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If the test lamp illuminates**

3. Vehicle OFF, connect the harness connector at the S117 Refuel Request Switch. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

4. Connect a test lamp between the signal circuit terminal 7 and ground.

5. Verify the test lamp turns ON and OFF by pressing the S117 Refuel Request Switch.

- **If the test lamp is always OFF**

1. Vehicle OFF, disconnect the harness connector at the S117 Refuel Request Switch.

2. Test for infinite resistance between the signal circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , test or replace the S117 Refuel Request Switch.

- **If the test lamp is always ON**

1. Vehicle OFF, disconnect the harness connector at the S117 Refuel Request Switch, Vehicle in

Service Mode.

2. Test for less than 1 V between the control circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, test or replace the S117 Refuel Request Switch.

• **If the test lamp turns ON and OFF**

6. Replace the K114B Hybrid/EV Powertrain Control Module 2.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the S117 Refuel Request Switch.

2. Test for infinite resistance between the signal terminal 2 and the B+ terminal 1 with the switch in the open position.

• **If less than infinite resistance**

Replace the S117 Refuel Request Switch.

• **If infinite resistance**

3. Test for less than 3 Ω between the signal terminal 2 and the B+ terminal 1 with the switch in the closed position.

• **If 3 Ω or greater**

Replace the S117 Refuel Request Switch.

• **If less than 3 Ω**

4. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Fuel Tank Filler Door Lock Release Switch Replacement](#)
- Refer to [Control Module References](#) for the hybrid powertrain control module 2 replacement, programming and setup

SYMPTOMS - VEHICLE ACCESS

NOTE: The following steps must be completed before using the symptom tables.

1. Perform the [Diagnostic System Check - Vehicle](#), before using the Symptom Tables in order to verify that all of the following are true:

- There are no DTCs set
- The control modules can communicate via the serial data link

2. Review the system operation in order to familiarize yourself with the system functions. Refer to the following systems description:

- [Door Ajar Indicator Description and Operation](#)
- [Rear Hatch/Gate Description and Operation](#)

- [Power Door Locks Description and Operation](#)
- [Liftgate Ajar Indicator Description and Operation](#)
- [Fuel Fill Door Description and Operation](#)
- [Charge Port Door Description and Operation](#)

Visual/Physical Inspection

- Inspect for aftermarket devices which may affect the operation of the system. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components for obvious damage or conditions which may cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [Exterior Door Handle Switch Malfunction](#)
- [Power Door Lock Key Cylinder Switches Malfunction](#)
- [Door Ajar Indicator Malfunction](#)
- [Power Door Locks Malfunction](#)
- [Hatch Release Malfunction](#)
- [Rear Hatch/Gate Ajar Indicator Malfunction](#)
- [Fuel Filler Door Release Malfunction](#)
- [Fuel Filler Door Ajar Indicator Malfunction](#)
- [Charger Door Ajar Indicator Malfunction](#)

CHARGER DOOR AJAR INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Ground	-	P0CCE 00	P0CCC 00	-	-

Circuit/System Description

The hybrid/EV powertrain control module 2 provides a 5V signal through a pull-up resistor to the charge port door position sensor circuit. The other end of the charge port door position sensor circuit is connected to the charge port door position switch. The hybrid/EV powertrain control module 2 monitors the voltage on the charge port door position sensor circuit. In normal operation, the hybrid/EV powertrain control module 2 sends a serial data message to the driver information center in the instrument panel cluster to display the Charge Door Open message.

Conditions for Running the DTC

hybrid/EV powertrain control module 2 must be awake.

Conditions for Setting the DTC

P0CCC 00

The hybrid/EV powertrain control module 2 detects the charge port door position sensor signal circuit voltage is mid range between expected high and low voltage values

P0CCE 00

The hybrid/EV powertrain control module 2 detects a short to ground in the charge port position sensor circuit.

P0CCF 00

The hybrid/EV powertrain control module 2 detects a short to voltage or an open/high resistance in the charge port position sensor circuit.

Action Taken When the DTC Sets

The Charge Door Open message will not illuminate when the charge port door is open or ajar.

Conditions for Clearing the DTC

DTC P0CCC 00, P0CCE 00 and P0CCF 00 are type C DTCs

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Charge Port Door parameter changes between Open and Closed when opening and closing the charge port door.
 - **If the parameter does not change**

Refer to Circuit/System Testing.
 - **If the parameter changes**
3. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the B197 Charge Port Door Position Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal C and ground.
 - **If 10 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
3. Vehicle in Service Mode, test for 4.8 - 5.2 V between the 5 V reference circuit terminal A and ground.
 - **If less than 4.8 V**
 1. Vehicle OFF, disconnect the harness connector at the K114B Hybrid/EV Powertrain Control

Module 2.

2. Test for infinite resistance between the 5 V reference circuit and ground
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the 5 V reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K114B Hybrid/EV Powertrain Control Module 2.
- **If greater than 5.2 V**
 1. Vehicle OFF, disconnect the harness connector at the K114B Hybrid/EV Powertrain Control Module 2, Vehicle in Service Mode.
 2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
- **If between 4.8 - 5.2 V**
4. Test or replace the B197 Charge Port Door Position Switch.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the B197 Charge Port Door Position Switch.
2. Test for 180 - 190 Ω between the signal terminal A and the ground terminal C with the switch in the open position.
 - **If 191 Ω or greater**

Replace the B197 Charge Port Door Position Switch.
 - **If 179 Ω or less**

Replace the B197 Charge Port Door Position Switch.
 - **If 180 - 190 Ω**
3. Test for 2040 - 2065 Ω between the signal terminal A and the ground terminal C with the switch in the closed position.
 - **If 2066 Ω or greater**

Replace the B197 Charge Port Door Position Switch.
 - **If 2039 Ω or less**

Replace the B197 Charge Port Door Position Switch.
 - **If 2040 - 2065 Ω**
4. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to [Charge Port Door Ajar Indicator Switch Replacement](#)
- Refer to [Control Module References](#) for the hybrid/EV powertrain control module 2 replacement, programming and setup

EXTERIOR DOOR HANDLE SWITCH MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

Circuit/System Description

For an overview of the component/system, refer to: [Power Door Locks Description and Operation](#)

Circuit	Description
Signal	The control module input circuit has an internal resistance connected to 12 V.

Circuit	Description
Ground	Chassis Ground

Component	Description
B27D Door Handle Switch - Driver Exterior	The switch has a normally open contact. When the switch is activated, the signal circuit to the control module is grounded.
B27P Door Handle Switch - Passenger Exterior	The switch has a normally open contact. When the switch is activated, the signal circuit to the control module is grounded.
B27LR Door Handle Switch - Left Rear Exterior	The switch has a normally open contact. When the switch is activated, the signal circuit to the control module is grounded.
B27RR Door Handle Switch - Right Rear Exterior	The switch has a normally open contact. When the switch is activated, the signal circuit to the control module is grounded.
K84 Keyless Entry Control Module	The control module also reads various switches and sensors and makes their values available via serial data.

Circuit/System Verification

1. Ignition - On/Vehicle - In Service Mode
2. B27D Door Handle Switch - Driver Exterior - Not Pressed

Verify the scan tool parameter: Exterior Driver Door Handle Switch = Inactive

- **If not the specified state**

Refer to: Circuit/System Testing

- **If the specified state**

3. B27P Door Handle Switch - Passenger Exterior - Not Pressed

Verify the scan tool parameter: Exterior Passenger Door Handle Switch = Inactive

- **If not the specified state**

Refer to: Circuit/System Testing

- **If the specified state**

4. B27LR Door Handle Switch - Left Rear Exterior - Not Pressed

Verify the scan tool parameter: Exterior Left Rear Door Handle Switch = Inactive

- **If not the specified state**

Refer to: Circuit/System Testing

- **If the specified state**

5. B27RR Door Handle Switch - Right Rear Exterior - Not Pressed

Verify the scan tool parameter: Exterior Right Rear Door Handle Switch = Inactive

- **If not the specified state**

Refer to: Circuit/System Testing

- **If the specified state**

6. Operate the component: B27D Door Handle Switch - Driver Exterior - Pressed

Verify the scan tool parameter: Exterior Driver Door Handle Switch = Active

- **If not the specified state**

Refer to: Circuit/System Testing

- **If the specified state**

7. Operate the component: B27P Door Handle Switch - Passenger Exterior - Pressed

Verify the scan tool parameter: Exterior Passenger Door Handle Switch = Active

- **If not the specified state**

Refer to: Circuit/System Testing

- **If the specified state**

8. Operate the component: B27LR Door Handle Switch - Left Rear Exterior - Pressed

Verify the scan tool parameter: Exterior Left Rear Door Handle Switch = Active

- **If not the specified state**

Refer to: Circuit/System Testing

- **If the specified state**

9. Operate the component: B27RR Door Handle Switch - Right Rear Exterior - Pressed

Verify the scan tool parameter: Exterior Right Rear Door Handle Switch = Active

- **If not the specified state**

Refer to: Circuit/System Testing

- **If the specified state**

10. All OK.

Circuit/System Testing

NOTE: It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.

1. Ignition/Vehicle & All vehicle systems - Off

2. Disconnect the appropriate electrical connector: A24 Door Handle Assembly

3. Test for less than 10 ohms between the test points: Ground circuit terminal 5 & Ground

- **If 10 ohms or greater**

1. Disconnect Ground Connection

2. Test for less than 2 ohms between the test points: Ground circuit terminal 5 @ Component harness & Ground Connection

- If 2 ohms or greater - Repair the open/high resistance in the circuit.
- If less than 2 ohms - Repair the open/high resistance in the ground connection.

- **If less than 10 ohms**

4. Ignition - On/Vehicle - In Service Mode

5. Verify the scan tool parameter: Exterior Door Handle Switch Circuit = Inactive

- **If not the specified state**

1. Ignition/Vehicle - Off

2. Disconnect the electrical connector: X2 @ K84 Keyless Entry Control Module

3. Test for infinite resistance between the test points: Signal circuit terminal 1 @ Component harness & Ground

- If less than infinite resistance - Repair the short to ground on the circuit.
- If infinite resistance - Replace the component: K84 Keyless Entry Control Module

- **If the specified state**

6. Connect a 3 A fused jumper wire between the test points: Signal circuit terminal 1 & Ground circuit terminal 5
7. Verify the scan tool parameter: Exterior Door Handle Switch Circuit = Active

- **If not the specified state**

1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
2. Disconnect the electrical connector: X2 @ K84 Keyless Entry Control Module
3. Ignition - On/Vehicle - In Service Mode
4. Test for less than 1 V between the test points: Signal circuit terminal 1 @ Component harness & Ground
 - If 1 V or greater - Repair the short to voltage on the circuit.
 - If less than 1 V
5. Ignition/Vehicle - Off
6. Test for less than 2 ohms between the test points:
 - Signal circuit terminal 1 @ A24D Door Handle Assembly - Driver Exterior & Terminal 12 X2 @ Control module harness
 - Signal circuit terminal 1 @ A24P Door Handle Assembly - Passenger Exterior & Terminal 11 X2 @ Control module harness
 - Signal circuit terminal 1 @ A24LR Door Handle Assembly - Left Rear Exterior & Terminal 2 X2 @ Control module harness
 - Signal circuit terminal 1 @ A24RR Door Handle Assembly - Right Rear Exterior & Terminal 1 X2 @ Control module harness
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Replace the component: K84 Keyless Entry Control Module

- **If the specified state**

8. Test or replace the component: A24 Door Handle Assembly

Component Testing

1. Ignition/Vehicle - Off
2. Disconnect the appropriate electrical connector: A24 Door Handle Assembly
3. Test for infinite resistance between the test points: Signal terminal 1 & Ground terminal 5 - Not Pressed

- **If less than infinite resistance**

Replace the component: A24 Door Handle Assembly

- **If infinite resistance**

4. Test for less than 3 ohms between the test points: Signal terminal 1 & Ground terminal 5 - Pressed

- **If 3 ohms or greater**

Replace the component: A24 Door Handle Assembly

- **If less than 3 ohms**

5. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: [Diagnostic Repair Verification](#)

- Refer to [Front Side Door Outside Handle Replacement \(Base\)](#)[Front Side Door Outside Handle Replacement \(Pass Key Entry ATH\)](#)
- Refer to [Rear Side Door Outside Handle Replacement](#)

FUEL FILLER DOOR AJAR INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Fuel Door Position Sensor Signal	P04B9 00	P04B9 00	P04BA 00	P04DC 00
Fuel Door Status Switch Ground	-	P04B9 00	-	-

Circuit/System Description

The hybrid powertrain control module 2 provides a 5V signal through a pull-up resistor to the fuel door position sensor circuit. The other end of the fuel door position sensor circuit is connected to the fuel door position sensor in the fuel door status switch assembly. The hybrid powertrain control module 2 monitors the voltage on the fuel door position sensor circuit. In normal operation, when the fuel door moves to the open position, the switch in the fuel door lock position closes and lowers the voltage on the fuel door lock position sensor circuit.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Fuel Door Position parameter changes between Open and Closed when opening and closing the fuel filler door.
 - **If the parameter does not change**
Refer to Circuit/System Testing.
 - **If the parameter changes**
3. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the B208 Fuel Door Status Switch Assembly. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
 - **If 10 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
3. Vehicle in Service Mode, test for 4.8 - 5.2 V between the 5 V reference circuit terminal 1 and ground.
 - **If less than 4.8 V**
 1. Vehicle OFF, disconnect the harness connector at the K114B Hybrid Powertrain Control Module 2.
 2. Test for infinite resistance between the 5 V reference circuit and ground
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the 5 V reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K114B Hybrid Powertrain Control Module 2.
 - **If greater than 5.2 V**
 1. Vehicle OFF, disconnect the harness connector at the K114B Hybrid Powertrain Control Module 2, Vehicle in Service Mode.

2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K114B Hybrid Powertrain Control Module 2.

- **If between 4.8 - 5.2 V**

4. Test or replace the B208 Fuel Door Status Switch Assembly.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the B208 Fuel Door Status Switch Assembly.
2. Test for 180 - 190 Ω between the signal terminal 1 and the ground terminal 2 with the switch in the open position.

- **If 191 Ω or greater**

Replace the B208 Fuel Door Status Switch Assembly.

- **If 179 Ω or less**

Replace the B208 Fuel Door Status Switch Assembly.

- **If 180 - 190 Ω**

3. Test for 2040 - 2065 Ω between the signal terminal 1 and the ground terminal 2 with the switch in the closed position.

- **If 2066 Ω or greater**

Replace the B208 Fuel Door Status Switch Assembly.

- **If 2039 Ω or less**

Replace the B208 Fuel Door Status Switch Assembly.

- **If 2040 - 2065 Ω**

4. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- Refer to **Fuel Tank Filler Pipe Housing Replacement**
- Refer to **Control Module References** for the hybrid powertrain control module 2 replacement, programming and setup

FUEL FILLER DOOR RELEASE MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Refuel Request Switch B+	P04CA 00	P04CA 00	-	-
Refuel Request Wakeup Signal	P169D 00	P169D 00	P169D 00	-
Refuel Request Signal	P04CA 00	P04CA 00	P04CB 00	-
Fuel Fill Door Lock Control	P04BB 00	P04BB 00	P04BB 00	-
Fuel Fill Door Unlock Control	P04BB 00	P04BB 00	P04BB 00	-
Refuel Request Switch Low Reference	-	P04CA 00	-	-

Circuit/System Description

The hybrid/EV powertrain control module 2 monitors the voltage values of the fuel fill door open request wake-up signal circuit and the fuel door request signal circuit. When the refuel request switch is pressed, the two switch contacts close. This provide B+ to the wake-up circuit input of the hybrid/EV powertrain control module 2 and lowers the voltage on the fuel door request signal circuit input to the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 detects the voltage on the signal circuits and commands the fuel system to vent and sends a serial data message to the driver information center to display the Wait to Refuel message. The hybrid/EV powertrain control module 2 then energizes the fuel door lock/unlock actuator to unlock the fuel door.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the M97 Fuel Door Lock Actuator will LOCK and UNLOCK when commanding the Fuel Fill Door Lock to Lock and Unlock with a scan tool.
 - **If the LOCK and UNLOCK function for the M97 Fuel Door Lock Actuator does not work**
Refer to Circuit/System Testing - Fuel Door Release Inoperative.
 - **If the LOCK and UNLOCK function for the M97 Fuel Door Lock Actuator works**
3. Verify the M97 Fuel Door Lock Actuator will UNLOCK when pressing the S117 Refuel Request Switch.
 - **If the UNLOCK function for the M97 Fuel Door Lock Actuator does not work**
Refer to Circuit/System Testing - Refuel Request Switch Inoperative When Module Is Awake
 - **If the M97 Fuel Door Lock Actuator UNLOCKS**
4. Vehicle OFF, it may take up to 2 minutes for the K114B Hybrid/EV Powertrain Control Module 2 to enter the sleep mode.
5. Verify the M97 Fuel Door Lock Actuator will UNLOCK when pressing the Refuel Request Switch.
 - **If the UNLOCK function for the M97 Fuel Door Lock Actuator does not work**
Refer to Circuit/System Testing - Refuel Request Switch Inoperative When Module Is Asleep
 - **If the M97 Fuel Door Lock Actuator UNLOCKS**
6. All OK.

Circuit/System Testing

Fuel Door Release Inoperative

1. Vehicle OFF, disconnect the harness connector at the M97 Fuel Door Lock Actuator.
2. Test for greater than 10 V between the control circuit terminal 1 and ground.
 - **If 10 V or less**
 1. Vehicle OFF, disconnect the harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance on the circuit.
 - If less than 2 Ω , replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If greater than 10 V**
3. Test for greater than 10 V between the control circuit terminal 2 and ground.
 - **If 10 V or less**
 1. Vehicle OFF, disconnect the harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance on the circuit.
 - If less than 2 Ω , replace the K114B Hybrid/EV Powertrain Control Module 2.
- **If greater than 10 V**
4. Connect a test lamp between control circuit terminal 1 and control circuit terminal 2, Vehicle in Service Mode.
5. Verify the test lamp turns ON when commanding the LOCK and UNLOCK states with a scan tool.
 - **If the test lamp remains OFF during either of the commands**
 1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode
 2. Test for less than 1 V between each control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V replace the K114B Hybrid/EV Powertrain Control Module 2
 - **If the test lamp turns ON during each of the commands**
6. Test or replace the M97 Fuel Door Lock Actuator.

Refuel Request Switch Inoperative When Module Is Awake

1. Vehicle OFF, disconnect the harness connector at the S117 Refuel Request Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 6 and ground.
 - **If 10 Ω or greater**
 1. Ignition OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
3. Vehicle in Service Mode, test for 4.8 - 5.2 V between the 5 V reference circuit terminal 3 and ground.
 - **If less than 4.8 V**
 1. Vehicle OFF, disconnect the harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
 2. Test for infinite resistance between the 5 V reference circuit and ground
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the 5 V reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If greater than 5.2 V**

1. Vehicle OFF, disconnect the harness connector at the K114B Hybrid/EV Powertrain Control Module 2, Vehicle in Service Mode.
2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If between 4.8 - 5.2 V**

4. Test or replace the S117 Refuel Request Switch.

Refuel Request Switch Inoperative When Module Is Asleep

1. Vehicle OFF, disconnect the harness connector at the S117 Refuel Request Switch. Vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Vehicle OFF.
2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Vehicle OFF.
2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
4. Test for infinite resistance between the signal circuit terminal 2 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If the test lamp illuminates**

3. Vehicle OFF, connect the harness connector at the S117 Refuel Request Switch. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
4. Connect a test lamp between the signal circuit terminal 7 and ground.
5. Verify the test lamp turns ON and OFF by pressing the S117 Refuel Request Switch.

- **If the test lamp is always OFF**

1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the S117 Refuel Request Switch.
2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , test or replace the S117 Refuel Request Switch.

- **If the test lamp is always ON**

1. Vehicle OFF, disconnect the harness connector at the S117 Refuel Request Switch, Vehicle in Service Mode.
2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, test or replace the S117 Refuel Request Switch.

- **If the test lamp turns ON and OFF**

6. Replace the K114B Hybrid/EV Powertrain Control Module 2.

Component Testing

Fuel Door Open Request Switch

1. Vehicle OFF, disconnect the harness connector at the S117 Refuel Request Switch.
2. Test for infinite resistance between the signal terminal 2 and the B+ terminal 1 with the switch in the open position.
 - **If less than infinite resistance**
Replace the S117 Refuel Request Switch.
 - **If infinite resistance**
3. Test for less than 3 Ω between the signal terminal 2 and the B+ terminal 1 with the switch in the closed position.
 - **If 3 Ω or greater**
Replace the S117 Refuel Request Switch.
 - **If less than 3 Ω**
4. All OK

Fuel Door Lock Actuator

1. Vehicle OFF, disconnect the harness connector at the M97 Fuel Door Lock Actuator.
2. Install a 25 A fused jumper wire between one of the control terminals and 12 V. Momentarily install a jumper wire between the other control terminal and ground. Reverse the jumper wires at least two times, the M97 Fuel Door Lock Actuator should perform the LOCK and UNLOCK function.
 - **If the actuator does not perform the LOCK and UNLOCK function**
Replace the M97 Fuel Door Lock Actuator.
 - **If the actuator performs the LOCK and UNLOCK function**
3. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

1. S46 Liftgate Handle Switch - Disabled 2. A23C Liftgate Latch Assembly - Inoperative				

Circuit/System Description

For an overview of the component/system, refer to: [Rear Hatch/Gate Description and Operation](#)

Circuit	Description
B+ - Relay Switch	Supplied from a fuse.
Signal	The control module input circuit has an internal resistance connected to 12 V.
Control - Component	The output circuit is switched to 12 V to activate the component.
Control - Relay Coil	The output circuit is switched to ground to activate the component.
Ground - Component	Chassis Ground

Component	Description
S46 Liftgate Handle Switch	• The switch has a normally open contact. • When the switch is activated, the signal circuit to the control module is grounded.
A23C Liftgate Latch Assembly	The DC motor unlatches the liftgate. Once the liftgate is unlatched, a switch in the latch will close, grounding the signal circuit to the BCM.
KR95A Liftgate Unlatch Relay	A relay is a switch that is actuated by a solenoid.
K9 Body Control Module	The module controls various vehicle functions like lighting, central door locking, power windows, etc.

Circuit/System Verification

1. Ignition - On/Vehicle - In Service Mode
2. Perform the scan tool control function: Rear Body Closure Unlatch - Unlatch

Verify a click can be heard or felt at the component when it is turned On and Off: A23C Liftgate Latch Assembly

- **If a click cannot be heard or felt**

Refer to: Circuit/System Testing - Test 2

- **If a click can be heard or felt**

3. Operate the component: S46 Liftgate Handle Switch - Pressed

Verify a click can be heard or felt at the component when it is turned On and Off: A23C Liftgate Latch Assembly

- **If a click cannot be heard or felt**

Refer to: Circuit/System Testing - Test 2

- **If a click can be heard or felt**

4. All OK.

Circuit/System Testing

Test 1

NOTE: It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.

1. Ignition/Vehicle & All vehicle systems - Off
2. Remove the component: KR95A Liftgate Unlatch Relay
3. Test for less than 10 ohms between the test points: Ground circuit terminal 86 & Ground
 - **If 10 ohms or greater**
 1. Disconnect Ground Connection
 2. Test for less than 2 ohms between the test points: Ground circuit terminal 86 & Ground Connection
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
4. Connect a test lamp between the test points: Control circuit terminal 85 & Ground circuit terminal 86
5. Ignition - On/Vehicle - In Service Mode
6. Perform the scan tool control function: Rear Body Closure Unlatch - Unlatch

Verify the test lamp turns On and Off.

- **If the test lamp is always Off**

1. Ignition/Vehicle - Off & Remove - Test lamp
2. Disconnect the electrical connector: K9 Body Control Module
3. Test for infinite resistance between the test points: Control circuit terminal 85 @ Relay Socket & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance
4. Test for less than 2 ohms between the test points: Control circuit terminal 85 @ Relay Socket & Terminal 11 X5 @ Control module harness

- If 2 ohms or greater - Repair the open/high resistance in the circuit.
- If less than 2 ohms - Replace the component: K9 Body Control Module

• **If the test lamp is always On**

1. Ignition/Vehicle - Off & Remove - Test lamp
2. Disconnect the electrical connector: K9 Body Control Module
3. Ignition - On/Vehicle - In Service Mode
4. Test for less than 1 V between the test points: Control circuit terminal 85 @ Relay Socket & Ground
 - If 1 V or greater - Repair the short to voltage on the circuit.
 - If less than 1 V - Replace the component: K9 Body Control Module

• **If the test lamp turns On and Off**

7. Verify a test lamp turns On between the test points: B+ circuit terminal 87 & Ground

• **If the test lamp does not turn On and the circuit fuse is OK**

1. Ignition/Vehicle - Off & Remove - Test lamp
2. Test for less than 2 ohms between the test points: B+ circuit terminal 87 @ Relay Socket & Output terminal @ Fuse
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Verify the fuse is OK and there is voltage at the fuse.

• **If the test lamp does not turn On and the circuit fuse is open**

1. Ignition/Vehicle - Off & Remove - Test lamp
2. Test for infinite resistance between the test points: B+ circuit terminal 87 & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance
3. Disconnect the electrical connector: A23C Liftgate Latch Assembly
4. Test for infinite resistance between the test points: Control circuit terminal 30 @ Relay Socket & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance
5. Replace the component: Fuse
6. Install the component: KR95A Liftgate Unlatch Relay
7. Connect a test lamp between the test points: Control circuit terminal 3 & Ground circuit terminal 1
8. Ignition - On/Vehicle - In Service Mode
9. Perform the scan tool control function: Rear Body Closure Unlatch - Unlatch

Verify the test lamp turns On and Off.

- If the test lamp does not turn On and Off - Test or replace the component: KR95A Liftgate Unlatch Relay
- If the test lamp turns On and Off - Test or replace the component: A23C Liftgate Latch Assembly

- **If the test lamp turns On**

8. Momentarily connect a 7.5 A fused jumper wire between the test points: B+ circuit terminal 87 & Control circuit terminal 30

Verify the component does not turn On and Off when connecting and disconnecting the jumper wire:
A23C Liftgate Latch Assembly

- **If the component turns On and Off**

Test or replace the component: KR95A Liftgate Unlatch Relay

- **If the component does not turn On and Off**

9. Ignition/Vehicle & All vehicle systems - Off
10. Install the component: KR95A Liftgate Unlatch Relay
11. Disconnect the electrical connector: A23C Liftgate Latch Assembly
12. Test for less than 10 ohms between the test points: Ground circuit terminal 1 & Ground

- **If 10 ohms or greater**

1. Disconnect Ground Connection
2. Test for less than 2 ohms between the test points: Ground circuit terminal 1 @ Component harness & Ground Connection
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Repair the open/high resistance in the ground connection.

- **If less than 10 ohms**

13. Connect a test lamp between the test points: Control circuit terminal 3 & Ground circuit terminal 1
14. Ignition - On/Vehicle - In Service Mode
15. Perform the scan tool control function: Rear Body Closure Unlatch - Unlatch

Verify the test lamp turns On and Off.

- **If the test lamp is always Off**

Repair the open/high resistance in the circuit: Control Circuit

- **If the test lamp is always On**

Repair the short to voltage on the circuit: Control Circuit

- **If the test lamp turns On and Off**

16. Test or replace the component: A23C Liftgate Latch Assembly

Test 2

NOTE: It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.

1. Ignition/Vehicle & All vehicle systems - Off

2. Disconnect the electrical connector: S46 Liftgate Handle Switch
3. Test for less than 10 ohms between the test points: Ground circuit terminal 2 & Ground
 - **If 10 ohms or greater**
 1. Disconnect Ground Connection
 2. Test for less than 2 ohms between the test points: Ground circuit terminal 2 @ Component harness & Ground Connection
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
4. Ignition - On/Vehicle - In Service Mode
5. Verify the component is not activated: A23C Liftgate Latch Assembly
 - **If not the specified state**
 1. Ignition/Vehicle - Off
 2. Disconnect the electrical connector: K9 Body Control Module
 3. Test for infinite resistance between the test points: Signal circuit terminal 1 @ Component harness & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance - Replace the component: K9 Body Control Module
 - **If the specified state**
6. Momentarily connect a 3 A fused jumper wire between the test points: Signal circuit terminal 1 & Ground circuit terminal 2
7. Verify the component produces a clicking sound: A23C Liftgate Latch Assembly
 - **If a click cannot be heard or felt**
 1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
 2. Disconnect the electrical connector: K9 Body Control Module
 3. Ignition - On/Vehicle - In Service Mode
 4. Test for less than 1 V between the test points: Signal circuit terminal 1 @ Component harness & Ground
 - If 1 V or greater - Repair the short to voltage on the circuit.
 - If less than 1 V
 5. Ignition/Vehicle - Off
 6. Test for less than 2 ohms between the test points: Signal circuit terminal 1 @ Component harness & Terminal 15 X6 @ Control module harness
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Replace the component: K9 Body Control Module
 - **If a click can be heard or felt**
8. Test or replace the component: S46 Liftgate Handle Switch

Component Testing

A23C Liftgate Latch Assembly-Dynamic Test

1. Ignition/Vehicle - Off
2. Disconnect the electrical connector: A23C Liftgate Latch Assembly
3. Connect a jumper wire between the test points: Ground terminal 1 & Ground
4. Momentarily connect a 7.5 A fused jumper wire between the test points: Control terminal 3 & 12 V

Verify the component turns On and Off when connecting and disconnecting the jumper wire: A23C Liftgate Latch Assembly

- **If the component does not turn On and Off**

Replace the component: A23C Liftgate Latch Assembly

- **If the component turns On and Off**

5. All OK.

S46 Liftgate Handle Switch

1. Ignition/Vehicle - Off
2. Disconnect the electrical connector: S46 Liftgate Handle Switch
3. Test for infinite resistance between the test points: Signal terminal 1 & Ground terminal 2 - Not Pressed

- **If less than infinite resistance**

Replace the component: S46 Liftgate Handle Switch

- **If infinite resistance**

4. Test for less than 3 ohms between the test points: Signal terminal 1 & Ground terminal 2 - Pressed

- **If 3 ohms or greater**

Replace the component: S46 Liftgate Handle Switch

- **If less than 3 ohms**

Relay Test

1. Ignition/Vehicle - Off
2. Remove the component: KR95A Liftgate Unlatch Relay
3. Test for 70 to 110 ohms between the test points: Component terminal 85 & 86

- **If not between 70 and 110 ohms**

Replace the component: KR95A Liftgate Unlatch Relay

- **If between 70 and 110 ohms**

4. Test for infinite resistance between the test points:
 - Component terminal 30 & 85
 - Component terminal 30 & 86

- Component terminal 30 & 87
- Component terminal 85 & 87
- **If less than infinite resistance**

Replace the component: KR95A Liftgate Unlatch Relay

- **If infinite resistance**

5. Connect a 3 A fused jumper wire between the test points: Component terminal 86 & 12 V

Connect a jumper wire between the test points: Component terminal 85 & Ground

6. Test for less than 2 ohms between the test points: Component terminal 30 & 87

- **If 2 ohms or greater**

Replace the component: KR95A Liftgate Unlatch Relay

- **If less than 2 ohms**

7. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: [Diagnostic Repair Verification](#)

- Refer to [Relay Replacement \(Attached to Wire Harness\)](#) [Relay Replacement \(Within an Electrical Center\)](#)
- Refer to [Liftgate Latch Replacement](#)
- Refer to [Liftgate Release Switch Replacement](#)
- For control module replacement, programming, and setup refer to: [Control Module References](#)

DOOR AJAR INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

Diagnostic Fault Information

Circuit/System Verification

1. Ignition - On/Vehicle - In Service Mode
2. Verify the appropriate scan tool door ajar switch parameter changes when opening and closing the vehicle doors.
 - **{Driver Door Ajar Switch} If the parameter state does not change**
Refer to Circuit/System Testing - Test 1
 - **{Passenger Door Ajar Switch} If the parameter state does not change**
Refer to Circuit/System Testing - Test 2
 - **{Left Rear Door Ajar Switch} If the parameter state does not change**
Refer to Circuit/System Testing - Test 3
 - **{Right Rear Door Ajar Switch} If the parameter state does not change**
Refer to Circuit/System Testing - Test 4
 - **If the parameter state changes**
3. All OK.

Circuit/System Testing

Test 1

NOTE: It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.

1. Ignition/Vehicle & All vehicle systems - Off

2. Disconnect the electrical connector: A23D Door Latch Assembly - Driver
3. Test for less than 10 ohms between the test points: Ground circuit terminal 3 & Ground
 - **If 10 ohms or greater**
 1. Disconnect Ground Connection
 2. Test for less than 2 ohms between the test points: Ground circuit terminal 3 @ Component harness & Ground Connection
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
4. Ignition - On/Vehicle - In Service Mode
5. Verify the scan tool parameter: Driver Door Ajar Switch = Inactive
 - **If not the specified state**
 1. Ignition/Vehicle - Off
 2. Disconnect the electrical connector: M74D Window Motor - Driver
 3. Test for infinite resistance between the test points: Signal circuit terminal 1 @ Component harness & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance - Replace the component: M74D Window Motor - Driver
 - **If the specified state**
6. Connect a 3 A fused jumper wire between the test points: Signal circuit terminal 1 & Ground circuit terminal 3
7. Verify the scan tool parameter: Driver Door Ajar Switch = Active
 - **If not the specified state**
 1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
 2. Disconnect the electrical connector: M74D Window Motor - Driver
 3. Ignition - On/Vehicle - In Service Mode
 4. Test for less than 1 V between the test points: Signal circuit terminal 1 @ Component harness & Ground
 - If 1 V or greater - Repair the short to voltage on the circuit.
 - If less than 1 V
 5. Ignition/Vehicle - Off
 6. Test for less than 2 ohms between the test points: Signal circuit terminal 1 @ Component harness & Signal circuit terminal 6 @ M74D Window Motor - Driver
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Replace the component: M74D Window Motor - Driver
 - **If the specified state**
8. Test or replace the component: A23D Door Latch Assembly - Driver

Test 2

NOTE: It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the electrical connector: A23P Door Latch Assembly - Passenger
3. Test for less than 10 ohms between the test points: Ground circuit terminal 3 & Ground
 - **If 10 ohms or greater**
 1. Disconnect Ground Connection
 2. Test for less than 2 ohms between the test points: Ground circuit terminal 3 @ Component harness & Ground Connection
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
4. Ignition - On/Vehicle - In Service Mode
5. Verify the scan tool parameter: Passenger Door Ajar Switch = Inactive
 - **If not the specified state**
 1. Ignition/Vehicle - Off
 2. Disconnect the electrical connector: S79P Window Switch - Passenger
 3. Test for infinite resistance between the test points: Signal circuit terminal 5 @ Component harness & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance - Replace the component: S79P Window Switch - Passenger
 - **If the specified state**
6. Connect a 3 A fused jumper wire between the test points: Signal circuit terminal 5 & Ground circuit terminal 3
7. Verify the scan tool parameter: Passenger Door Ajar Switch = Active
 - **If not the specified state**
 1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
 2. Disconnect the electrical connector: S79P Window Switch - Passenger
 3. Ignition - On/Vehicle - In Service Mode
 4. Test for less than 1 V between the test points: Signal circuit terminal 5 @ Component harness & Ground
 - If 1 V or greater - Repair the short to voltage on the circuit.
 - If less than 1 V
 5. Ignition/Vehicle - Off
 6. Test for less than 2 ohms between the test points: Signal circuit terminal 5 @ Component harness & Signal circuit terminal 2 @ S79P Window Switch - Passenger
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Replace the component: S79P Window Switch - Passenger
 - **If the specified state**

8. Test or replace the component: A23P Door Latch Assembly - Passenger

Test 3

NOTE: It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the electrical connector: A23LR Door Latch Assembly - Left Rear
3. Test for less than 10 ohms between the test points: Ground circuit terminal 3 & Ground
 - **If 10 ohms or greater**
 1. Disconnect Ground Connection
 2. Test for less than 2 ohms between the test points: Ground circuit terminal 3 @ Component harness & Ground Connection
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
4. Ignition - On/Vehicle - In Service Mode
5. Verify the scan tool parameter: Left Rear Door Ajar Switch = Inactive
 - **If not the specified state**
 1. Ignition/Vehicle - Off
 2. Disconnect the electrical connector: S79LR Window Switch - Left Rear
 3. Test for infinite resistance between the test points: Signal circuit terminal 1 @ Component harness & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance - Replace the component: S79LR Window Switch - Left Rear
 - **If the specified state**
6. Connect a 3 A fused jumper wire between the test points: Signal circuit terminal 1 & Ground circuit terminal 3
7. Verify the scan tool parameter: Left Rear Door Ajar Switch = Active
 - **If not the specified state**
 1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
 2. Disconnect the electrical connector: S79LR Window Switch - Left Rear
 3. Ignition - On/Vehicle - In Service Mode
 4. Test for less than 1 V between the test points: Signal circuit terminal 1 @ Component harness & Ground
 - If 1 V or greater - Repair the short to voltage on the circuit.
 - If less than 1 V
 5. Ignition/Vehicle - Off
 6. Test for less than 2 ohms between the test points: Signal circuit terminal 1 @ Component harness & Terminal 2 @ S79LR Window Switch - Left Rear

- If 2 ohms or greater - Repair the open/high resistance in the circuit.
- If less than 2 ohms - Replace the component: S79LR Window Switch - Left Rear

- **If the specified state**

8. Test or replace the component: A23LR Door Latch Assembly - Left Rear

Test 4

NOTE: It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the electrical connector: A23RR Door Latch Assembly - Right Rear
3. Test for less than 10 ohms between the test points: Ground circuit terminal 3 & Ground
 - **If 10 ohms or greater**
 1. Disconnect Ground Connection
 2. Test for less than 2 ohms between the test points: Ground circuit terminal 3 @ Component harness & Ground Connection
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
4. Ignition - On/Vehicle - In Service Mode
5. Verify the scan tool parameter: Right Rear Door Ajar Switch = Inactive
 - **If not the specified state**
 1. Ignition/Vehicle - Off
 2. Disconnect the electrical connector: S79RR Window Switch - Right Rear
 3. Test for infinite resistance between the test points: Signal circuit terminal 5 @ Component harness & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance - Replace the component: S79RR Window Switch - Right Rear
 - **If the specified state**
6. Connect a 3 A fused jumper wire between the test points: Signal circuit terminal 5 & Ground circuit terminal 3
7. Verify the scan tool parameter: Right Rear Door Ajar Switch = Active
 - **If not the specified state**
 1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
 2. Disconnect the electrical connector: S79RR Window Switch - Right Rear
 3. Ignition - On/Vehicle - In Service Mode
 4. Test for less than 1 V between the test points: Signal circuit terminal 5 @ Component harness & Ground
 - If 1 V or greater - Repair the short to voltage on the circuit.
 - If less than 1 V

5. Ignition/Vehicle - Off
6. Test for less than 2 ohms between the test points: Signal circuit terminal 5 @ Component harness & Terminal 2 @ S79RR Window Switch - Right Rear
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Replace the component: S79RR Window Switch - Right Rear
- **If the specified state**
8. Test or replace the component: A23RR Door Latch Assembly - Right Rear

Component Testing

1. Ignition/Vehicle - Off
2. Disconnect the appropriate electrical connector: A23 Door Latch Assembly
3. Test for infinite resistance between the test points:
 - A23D Door Latch Assembly - Driver Signal terminal 1 & Ground terminal 3 - The switch is in the open position.
 - A23P Door Latch Assembly - Passenger Signal terminal 5 & Ground terminal 3 - The switch is in the open position.
 - A23LR Door Latch Assembly - Left Rear Signal terminal 1 & Ground terminal 3 - The switch is in the open position.
 - A23RR Door Latch Assembly - Right Rear Signal terminal 5 & Ground terminal 3 - The switch is in the open position.
 - **If less than infinite resistance**

Replace the component: A23 Door Latch Assembly
 - **If infinite resistance**
4. Test for less than 3 ohms between the test points:
 - A23D Door Latch Assembly - Driver Signal terminal 1 & Ground terminal 3 - The switch is in the closed position.
 - A23P Door Latch Assembly - Passenger Signal terminal 5 & Ground terminal 3 - The switch is in the closed position.
 - A23LR Door Latch Assembly - Left Rear Signal terminal 1 & Ground terminal 3 - The switch is in the closed position.
 - A23RR Door Latch Assembly - Right Rear Signal terminal 5 & Ground terminal 3 - The switch is in the closed position.
 - **If 3 ohms or greater**

Replace the component: A23 Door Latch Assembly
 - **If less than 3 ohms**
5. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: [Diagnostic Repair Verification](#)

- Refer to [Front Side Door Latch Replacement](#)

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	1	1	1	-
Ground	-	1	-	-
1. B29D Door Lock Key Cylinder Switch - Driver = Disabled				

Circuit/System Description

For an overview of the component/system, refer to: [Power Door Locks Description and Operation](#)

Circuit	Description
Signal	The control module input circuit has an internal resistance connected to 12 V.
Ground	Chassis Ground

Component	Description
A23 Door Latch Assembly	The door locks are actuated by a bidirectional DC motor that locks/unlocks the door so that it can not be opened from outside the vehicle (but still from inside). The assembly also contains a normally open door ajar switch that closes as soon as the door is not fully closed.
S146 Window/Outside Rearview Mirror Switch - Driver	The switch assembly has a 4-way switch to control the mirror movement (up, down, left, right) and a 2-position switch to select the left and right mirror.

Circuit/System Verification

1. Operate the component: S13D Door Lock Switch - Driver - Unlock
2. Operate the component: B29D Door Lock Key Cylinder Switch - Driver - Lock
3. Verify the component activates: A23LR Door Latch Assembly - Left Rear/A23P Door Latch Assembly - Passenger/A23RR Door Latch Assembly - Right Rear
 - **If the component does not work as specified**

Refer to: Circuit/System Testing
 - **If all functions work properly**
4. All OK.

Circuit/System Testing

NOTE: It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the electrical connector: A23D Door Latch Assembly - Driver
3. Test for less than 10 ohms between the test points: Ground circuit terminal 3 & Ground
 - **If 10 ohms or greater**
 1. Disconnect Ground Connection
 2. Test for less than 2 ohms between the test points: Ground circuit terminal 3 @ Component harness & Ground Connection

- If 2 ohms or greater - Repair the open/high resistance in the circuit.
- If less than 2 ohms - Repair the open/high resistance in the ground connection.

- **If less than 10 ohms**

4. Ignition - On/Vehicle - In Service Mode

5. Test for greater than 10 V between the test points: Signal circuit terminal 4 & Ground circuit terminal 3

- **If 10 V or less**

1. Ignition/Vehicle - Off

2. Disconnect the electrical connector: S146 Window/Outside Rearview Mirror Switch - Driver

3. Test for infinite resistance between the test points: Signal circuit terminal 4 @ Component harness & Ground

- If less than infinite resistance - Repair the short to ground on the circuit.
- If infinite resistance

4. Test for less than 2 ohms between the test points: Signal circuit terminal 4 @ Component harness & Signal circuit terminal 14 @ S146 Window/Outside Rearview Mirror Switch - Driver

- If 2 ohms or greater - Repair the open/high resistance in the circuit.
- If less than 2 ohms - Replace the component: S146 Window/Outside Rearview Mirror Switch - Driver

- **If greater than 10 V**

6. Test or replace the component: A23D Door Latch Assembly - Driver

Component Testing

1. Ignition/Vehicle - Off

2. Disconnect the electrical connector: A23D Door Latch Assembly - Driver

3. Test for infinite resistance between the test points: Signal terminal 4 & Ground terminal 3 - The switch is in the open position.

- **If less than infinite resistance**

Replace the component: A23D Door Latch Assembly - Driver

- **If infinite resistance**

4. Test for less than 3 ohms between the test points: Signal terminal 4 & Ground terminal 3 - The switch is in the closed position.

- **If 3 ohms or greater**

Replace the component: A23D Door Latch Assembly - Driver

- **If less than 3 ohms**

5. All OK.

Circuit/System Description

For an overview of the component/system, refer to: [Power Door Locks Description and Operation](#)

Circuit	Description
B+ - K9 Body Control Module	Supplied from a fuse.
Signal	The control module input circuit has an internal resistance connected to 12 V.
Control - Driver Door Unlock	The output circuit is switched from ground to 12 V to activate the component.
Control - All Doors Lock	The output circuit is switched from ground to 12 V to activate the component.
Control - Passenger Door Unlock	The output circuit is switched from ground to 12 V to activate the component.
Ground - S13D Door Lock Switch - Driver	Chassis Ground
Ground - S13P Door Lock Switch - Passenger	Chassis Ground
Ground - K9 Body Control Module	Chassis Ground

Component	Description
A23 Door Latch Assembly	The door locks are actuated by a bidirectional DC motor that locks/unlocks the door so that it can not be opened from outside the vehicle (but still from inside).
K9 Body Control Module	The module controls various vehicle functions like lighting, central door locking, power windows, etc.
S13P Door Lock Switch - Passenger	- The switch has a normally open contact. - When the switch is activated, the signal circuit to the control module is grounded.
S13D Door Lock Switch - Driver	- The switch has a normally open contact. - When the switch is activated, the signal circuit to the control module is grounded.

Circuit/System Verification

1. Ignition - On/Vehicle - In Service Mode
2. Verify the scan tool parameter: Driver Door Lock Switch = Inactive
 - **If not the specified state**

Refer to: Circuit/System Testing - Test 1
 - **If the specified state**
3. Operate the component: S13D Door Lock Switch - Driver - Lock & Unlock

Verify the scan tool parameter: Driver Door Lock Switch = Lock & Unlock
 - **If not the specified state**

Refer to: Circuit/System Testing - Test 1
 - **If the specified state**
4. Verify the scan tool parameter: Passenger Door Lock Switch = Inactive
 - **If not the specified state**

Refer to: Circuit/System Testing - Test 1

- **If the specified state**

5. Operate the component: S13P Door Lock Switch - Passenger - Lock & Unlock

Verify the scan tool parameter: Passenger Door Lock Switch = Lock & Unlock

- **If not the specified state**

Refer to: Circuit/System Testing - Test 1

- **If the specified state**

6. Operate the component: S13D Door Lock Switch - Driver - Lock & Unlock

Verify the component works as specified:

- A23D Door Latch Assembly - Driver = Lock & Unlock
- A23LR Door Latch Assembly - Left Rear = Lock & Unlock
- A23P Door Latch Assembly - Passenger = Lock & Unlock
- A23RR Door Latch Assembly - Right Rear = Lock & Unlock
- **If the component does not activate - A23D Door Latch Assembly - Driver**

Refer to: Circuit/System Testing - Test 2

- **If the component does not activate - A23LR Door Latch Assembly - Left Rear**

Refer to: Circuit/System Testing - Test 3

- **If the component does not activate - A23P Door Latch Assembly - Passenger**

Refer to: Circuit/System Testing - Test 3

- **If the component does not activate - A23RR Door Latch Assembly - Right Rear**

Refer to: Circuit/System Testing - Test 3

- **If none of the components operate**

Refer to: Circuit/System Testing - Test 4

- **If all functions work properly**

7. All OK.

Circuit/System Testing

Test 1

NOTE: It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.

1. Ignition/Vehicle & All vehicle systems - Off

2. Disconnect the appropriate electrical connector: S13D Door Lock Switch - Driver/S13P Door Lock Switch - Passenger
3. Test for less than 10 ohms between the test points: Ground circuit terminal 4 & Ground
 - **If 10 ohms or greater**
 1. Disconnect Ground Connection
 2. Test for less than 2 ohms between the test points: Ground circuit terminal 4 @ Component harness & Ground Connection
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
4. Ignition - On/Vehicle - In Service Mode
5. Verify the scan tool parameter: Driver Door Lock Switch or Passenger Door Lock Switch = Inactive
 - **If not the specified state**
 1. Ignition/Vehicle - Off
 2. Disconnect the electrical connector: X2/X6 @ K9 Body Control Module
 3. Test for infinite resistance between the test points:
 - Signal circuit terminal 2 @ Component harness & Ground
 - Signal circuit terminal 3 @ Component harness & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance - Replace the component: K9 Body Control Module
 - **If the specified state**
6. Connect a 3 A fused jumper wire between the test points: Signal circuit terminal 3 & Ground circuit terminal 4
7. Verify the scan tool parameter: Driver Door Lock Switch or Passenger Door Lock Switch = Unlock
 - **If not the specified state**
 1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
 2. Disconnect the electrical connector: X2 or X6 @ K9 Body Control Module
 3. Ignition - On/Vehicle - In Service Mode
 4. Test for less than 1 V between the test points: Signal circuit terminal 3 @ Component harness & Ground
 - If 1 V or greater - Repair the short to voltage on the circuit.
 - If less than 1 V
 5. Ignition/Vehicle - Off
 6. Test for less than 2 ohms between the test points:
 - Signal circuit terminal 3 @ S13D Door Lock Switch - Driver & Terminal 15 X2 @ Control module harness
 - Signal circuit terminal 3 @ S13P Door Lock Switch - Passenger & Terminal 6 X6 @ Control module harness
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.

- If less than 2 ohms - Replace the component: K9 Body Control Module

- **If the specified state**

8. Connect a 3 A fused jumper wire between the test points: Signal circuit terminal 2 & Ground circuit terminal 4
9. Verify the scan tool parameter: Driver Door Lock Switch or Passenger Door Lock Switch = Lock
 - **If not the specified state**
 1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
 2. Disconnect the electrical connector: X2 or X6 @ K9 Body Control Module
 3. Ignition - On/Vehicle - In Service Mode
 4. Test for less than 1 V between the test points: Signal circuit terminal 2 @ Component harness & Ground
 - If 1 V or greater - Repair the short to voltage on the circuit.
 - If less than 1 V
 5. Ignition/Vehicle - Off
 6. Test for less than 2 ohms between the test points:
 - Signal circuit terminal 2 @ S13D Door Lock Switch - Driver & Terminal 19 X2 @ Control module harness
 - Signal circuit terminal 2 @ S13P Door Lock Switch - Passenger & Terminal 13 X6 @ Control module harness
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Replace the component: K9 Body Control Module
 - **If the specified state**
10. Test or replace the component: S13D Door Lock Switch - Driver/S13P Door Lock Switch - Passenger

Test 2

1. Ignition/Vehicle - Off
2. Disconnect the electrical connector: A23D Door Latch Assembly - Driver
3. Connect a test lamp between the test points: Control circuit terminal 7 & Control circuit terminal 8
4. Ignition - On/Vehicle - In Service Mode
5. Operate the component: S13D Door Lock Switch - Driver - Lock & Unlock
6. Verify the test lamp does not turn On and Off.

- **If the test lamp turns On and Off**

Test or replace the component: A23D Door Latch Assembly - Driver

- **If the test lamp does not turn On and Off**

7. Ignition/Vehicle - Off
8. Disconnect the electrical connector: X6 @ K9 Body Control Module
9. Test for less than 2 ohms between the test points:
 - Control circuit terminal 7 @ Component harness & Terminal 1 X6 @ Control module harness

- Control circuit terminal 8 @ Component harness & Terminal 4 X6 @ Control module harness
- If 2 ohms or greater - Repair the open/high resistance in the circuit.
- **If less than 2 ohms**

10. Test or replace the component: K9 Body Control Module

Test 3

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the appropriate electrical connector:
 - A23LR Door Latch Assembly - Left Rear
 - A23P Door Latch Assembly - Passenger
 - A23RR Door Latch Assembly - Right Rear
3. Connect a test lamp between the test points:
 - A23P Door Latch Assembly - Passenger: Control circuit terminal 9 & Control circuit terminal 8
 - A23LR Door Latch Assembly - Left Rear: Control circuit terminal 7 & Control circuit terminal 8
 - A23RR Door Latch Assembly - Right Rear: Control circuit terminal 9 & Control circuit terminal 8
4. Ignition - On/Vehicle - In Service Mode
5. Operate the component: S13D Door Lock Switch - Driver - Lock & Unlock
6. Verify the test lamp does not turn On and Off.

- **If the test lamp turns On and Off**

Test or replace the component: A23 Door Latch Assembly

- **If the test lamp does not turn On and Off**

7. Ignition/Vehicle - Off
8. Disconnect the electrical connector: X6 @ K9 Body Control Module
9. Ignition - On/Vehicle - In Service Mode
10. Test for less than 2 ohms between the test points:
 - Control circuit terminal 7 @ A23LR Door Latch Assembly - Left Rear & Terminal 2 X6 @ Control module harness
 - Control circuit terminal 8 @ A23LR Door Latch Assembly - Left Rear & Terminal 4 X6 @ Control module harness
 - Control circuit terminal 8 @ A23P Door Latch Assembly - Passenger & Terminal 4 X6 @ Control module harness
 - Control circuit terminal 9 @ A23P Door Latch Assembly - Passenger & Terminal 2 X6 @ Control module harness
 - Control circuit terminal 8 @ A23RR Door Latch Assembly - Right Rear & Terminal 4 X6 @ Control module harness
 - Control circuit terminal 9 @ A23RR Door Latch Assembly - Right Rear & Terminal 2 X6 @ Control module harness
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - **If less than 2 ohms**

11. Test or replace the component: K9 Body Control Module

Test 4

NOTE: It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the electrical connector: X2 & X6 @ K9 Body Control Module
3. Test for less than 10 ohms between the test points: Ground circuit terminal 3 X6 & Ground
 - **If 10 ohms or greater**
 1. Disconnect Ground Connection
 2. Test for less than 2 ohms between the test points: Ground circuit terminal 3 X6 & Ground Connection
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
4. Ignition - On/Vehicle - In Service Mode
5. Verify a test lamp turns On between the test points: B+ circuit terminal 4 X2 & Ground
 - **If the test lamp does not turn On and the circuit fuse is OK**
 1. Ignition/Vehicle - Off & Remove - Test lamp
 2. Test for less than 2 ohms between the test points: B+ circuit terminal 4 X2 & Output terminal @ Fuse
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Verify the fuse is OK and there is voltage at the fuse.
 - **If the test lamp does not turn On and the circuit fuse is open**
 1. Ignition/Vehicle - Off & Remove - Test lamp
 2. Disconnect the electrical connector:
 - A23D Door Latch Assembly - Driver
 - A23LR Door Latch Assembly - Left Rear
 - A23P Door Latch Assembly - Passenger
 - A23RR Door Latch Assembly - Right Rear
 3. Test for infinite resistance between the test points:
 - Control circuit terminal 1 X6 @ K9 Body Control Module & Ground
 - Control circuit terminal 2 X6 @ K9 Body Control Module & Ground
 - Control circuit terminal 4 X6 @ K9 Body Control Module & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance - Replace the component: A23 Door Latch Assembly
 - **If the test lamp turns On**
6. Ignition/Vehicle - Off

7. Connect the electrical connector: X2 @ K9 Body Control Module

8. Ignition - On/Vehicle - In Service Mode

9. Test for less than 1 V between the test points:

- Control circuit terminal 1 X6 @ K9 Body Control Module & Ground
- Control circuit terminal 2 X6 @ K9 Body Control Module & Ground
- Control circuit terminal 4 X6 @ K9 Body Control Module & Ground
- **If greater than 1 V**

Repair the short to voltage on the circuit.

- **If 1 V or less**

10. Ignition/Vehicle - Off

11. Test for infinite resistance between the test points:

- Control circuit terminal 1 X6 @ K9 Body Control Module & Ground
- Control circuit terminal 2 X6 @ K9 Body Control Module & Ground
- Control circuit terminal 4 X6 @ K9 Body Control Module & Ground
- **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

12. Replace the component: K9 Body Control Module

Component Testing

S13 Door Lock Switch - Test

1. Ignition/Vehicle - Off

2. Disconnect the appropriate electrical connector: S13 Door Lock Switch

3. Test for infinite resistance between the test points:

- Signal terminal 2 & Ground terminal 4 - Switch - Not Pressed
- Signal terminal 3 & Ground terminal 4 - Switch - Not Pressed
- **If less than infinite resistance**

Replace the component: S13 Door Lock Switch

- **If infinite resistance**

4. Test for less than 3 ohms between the test points: Signal terminal 2 & Ground terminal 4 - Lock Switch - Pressed

- **If 3 ohms or greater**

Replace the component: S13 Door Lock Switch

- **If less than 3 ohms**

5. Test for less than 3 ohms between the test points: Signal terminal 3 & Ground terminal 4 - Unlock Switch

- Pressed

- **If 3 ohms or greater**

Replace the component: S13 Door Lock Switch

- **If less than 3 ohms**

6. All OK.

A23 Door Latch Assembly

1. Ignition/Vehicle - Off

2. Disconnect the appropriate electrical connector:

- A23D Door Latch Assembly - Driver
- A23P Door Latch Assembly - Passenger
- A23LR Door Latch Assembly - Left Rear
- A23RR Door Latch Assembly - Right Rear

3. Connect a 25 A fused jumper wire between the test points: Control terminal 8 & B+

CAUTION: Complete the testing as quickly as possible in order to prevent overheating and damaging the component.

4. Momentarily connect a jumper wire between the test points:

- A23D Door Latch Assembly - Driver: Control terminal 7 & Ground
- A23P Door Latch Assembly - Passenger: Control terminal 9 & Ground
- A23LR Door Latch Assembly - Left Rear: Control terminal 7 & Ground
- A23RR Door Latch Assembly - Right Rear: Control terminal 9 & Ground

5. Reverse the jumper wires 2 times between the terminals.

Verify the component works as specified: A23 Door Latch Assembly = Lock & Unlock

- **If not the specified state**

Replace the component: A23 Door Latch Assembly

- **If the specified state**

6. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: [Diagnostic Repair Verification](#)

- Refer to [Front Side Door Latch Replacement](#)
- Refer to [Rear Side Door Latch Replacement](#)
- Refer to [Door Lock Switch Replacement - Driver Side](#)
- Refer to [Door Lock Switch Replacement - Passenger Front](#)
- Refer to [Front Side Door Window Control Switch Replacement](#)

- For control module replacement, programming, and setup refer to: [Control Module References](#)

REAR HATCH/GATE AJAR INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	1	2	2	-
Ground	-	3	-	-
1. Trunk Open Display Message = Always On 2. Trunk Open Display Message = Disabled 3. A23C Liftgate Latch Assembly = Disabled				

Circuit/System Description

For an overview of the component/system, refer to: [Liftgate Ajar Indicator Description and Operation](#)

Circuit	Description
Signal	The control module input circuit has an internal resistance connected to 12 V.
Ground	Chassis Ground

Component	Description
A23C Liftgate Latch Assembly	The DC motor unlatches the liftgate. Once the liftgate is unlatched, a switch in the latch will close, grounding the signal circuit to the control module K9.
K9 Body Control Module	The module controls various vehicle functions like lighting, central door locking, power windows, etc.

Scan Tool Reference

Control Module References

Circuit/System Verification

1. Ignition - On/Vehicle - In Service Mode
2. Operate the component: Liftgate - Closed

Verify the scan tool parameter: Rear Closure Ajar Switch = Inactive

- **If not the specified state**

Refer to: Circuit/System Testing

- **If the specified state**

3. Operate the component: Liftgate - Ajar

Verify the scan tool parameter: Rear Closure Ajar Switch = Active

- **If not the specified state**

Refer to: Circuit/System Testing

- **If the specified state**

4. All OK.

Circuit/System Testing

1. Ignition/Vehicle - Off
2. Disconnect the electrical connector: A23C Liftgate Latch Assembly
3. Ignition - On/Vehicle - In Service Mode
4. Verify the scan tool parameter: Rear Closure Ajar Switch = Inactive
 - **If not the specified state**
 1. Ignition/Vehicle - Off
 2. Disconnect the electrical connector: K9 Body Control Module
 3. Test for infinite resistance between the test points: Signal circuit terminal 2 @ Component harness & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.

- If infinite resistance - Replace the component: K9 Body Control Module

- **If the specified state**

5. Connect a 3 A fused jumper wire between the test points: Signal circuit terminal 2 & Ground circuit terminal 1
6. Verify the scan tool parameter: Rear Closure Ajar Switch = Active
 - **If not the specified state**
 1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
 2. Disconnect the electrical connector: K9 Body Control Module
 3. Ignition - On/Vehicle - In Service Mode
 4. Test for less than 1 V between the test points: Signal circuit terminal 2 @ Component harness & Ground
 - If 1 V or greater - Repair the short to voltage on the circuit.
 - If less than 1 V
 5. Ignition/Vehicle - Off
 6. Test for less than 2 ohms between the test points: Signal circuit terminal 2 @ Component harness & Terminal 5 X6 @ Control module harness
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Replace the component: K9 Body Control Module
 - **If the specified state**
7. Test or replace the component: A23C Liftgate Latch Assembly

Component Testing

1. Ignition/Vehicle - Off
2. Disconnect the electrical connector: A23C Liftgate Latch Assembly
3. Test for infinite resistance between the test points: Signal terminal 2 & Ground terminal 1 - The switch is in the open position.
 - **If less than infinite resistance**
Replace the component: A23C Liftgate Latch Assembly
 - **If infinite resistance**
4. Test for less than 3 ohms between the test points: Signal terminal 2 & Ground terminal 1 - The switch is in the closed position.
 - **If 3 ohms or greater**
Replace the component: A23C Liftgate Latch Assembly
 - **If less than 3 ohms**
5. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: [Diagnostic Repair Verification](#)

- Refer to [Liftgate Latch Replacement](#)
- For control module replacement, programming, and setup refer to: [Control Module References](#)

DOOR WILL NOT OPEN/CLOSE, DOOR BINDING, OR LOCKS, HANDLES, OR CYLINDERS DO NOT FUNCTION

Step	Action	Yes	No
DEFINITION: This diagnostic table is designed to address the mechanical diagnosis of the door latching system, which could include the inside and outside handles, latch rods/cables, latches, or latch cylinders.			
1	Did you perform the Diagnostic System Check - Vehicle?	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	Were you sent here from a Vehicle Access Symptom Table?	Go to Step 3	Go to Symptoms - Vehicle Access
3	Does the door open with the outside handle?	Go to Step 4	Go to Step 10
4	Does the door open with the inside handle?	Go to Step 5	Go to Step 11
5	Does the manual latch knob latch and unlatch the latch smoothly without binding?	Go to Step 6	Go to Step 12
6	Does the door latch switch and/or the keyless entry transmitter latch and unlatch the door latch or door latches?	Go to Step 7	Go to Step 14
7	Is the outside key cylinder loose or does it rattle or fall out? (if equipped)	Go to Step 15	Go to Step 8
8	Does the outside key cylinder latch and unlatch the latch and function smoothly without binding? (if equipped)	Go to Step 9	Go to Step 16
9	Does the door bind, does it take excessive effort to open, or is it misaligned?	Go to Step 17	Go to Step 18
10	If the door will not open with the outside handle, or the handle is obstructed or loose, check the following: • For cold weather freezing, thaw as necessary. • Check the handle for foreign material. Remove material as necessary. • Check the handle grab bar for looseness or damage. Repair as necessary. • Check the handle for full travel. If the issue is not resolved, remove the trim panel as necessary to gain access to door hardware and check the following: • Check the handle chassis for loose fasteners, broken chassis inserts, loose or missing spring, or a loose, missing or bent rod lever.	Go to Step 18	Go to Step 11

Step	Action	Yes	No
	• Check for bent rod to the outside handle. • Check that the handle grab bar engages the rod lever properly. • Check for interference of rod and handle to other components in the door. • Check that handle rod is securely attached at both latch and handle. • Check if rod is positioned properly in the clip on the latch. At rest position, the handle should be fully against the down stop and the latch lever should be at the bottom of its travel. Correct by opening clip, repositioning rod in clip and closing clip till it snaps, as necessary. Did you find and correct the condition?		
11	Door will not open with the inside handle: • Check the inside handle for foreign material. Remove material as necessary. • Check that the handle is secure. Correct as necessary. • If rear door, verify child security is not engaged. • Remove the trim panel as necessary to and check the inside handle rod/cable attachments at both the latch and handle. If the cable is kinked or pinched, correct as necessary. Did you find and correct the condition?	Go to Step 18	Go to Step 12
12	The door will not or is difficult to unlatch with the inside manual latch knob: • For cold weather freezing, thaw as necessary • Check the latch knob for a loose condition. Repair or replace as necessary. Check the latch knob for binding or dragging using the following procedure: 1. Remove the latch knob. 2. If condition goes away, check for drag/interference of the latch knob against the inner belt seal, or the trim panel. Correct as	Go to Step 18	Go to Step 13

Step	Action	Yes	No
	required. If further action is required, remove the trim panel and check the latch rod and latch knob for interference with the following: • Water deflector/paper • Side impact foam • Rod grommet in sheet metal • Glass run channel • Other rods or cables • Trim panel Did you find and correct the condition?		
13	With a manual lock, if the latch will not function properly do the following: 1. Function the lock/unlatch lever on the latch to unlatch the latch. Check for high internal resistance. 2. With the door open, manually close the latch with a screwdriver. 3. Check the latch for internal binding by actuating the latch with the inside door handle lever. 4. Manually close the latch with a screwdriver again. 5. Check the latch for internal binding by actuating the latch with the outside door handle lever. Did you find and correct the condition?	Go to Step 18	Go to Step 14
14	If power locks are included in vehicle options and do not function with either the keyless entry transmitter or switch: 1. For cold weather freezing, thaw as necessary. 2. Remove trim pad as required and check the following: • Verify door harness has appropriate power connectors for switches and latch. • Check harness connector pins for corrosion.	Go to Step 18	Go to Step 15

Step	Action	Yes	No
	- Assure wire harness connectors are seated and locked properly at latch and switch. Remove and re-seat if required. - Check door harness for cuts/chafing /corrosion. Correct/replace as required. - Check for 12V at latch and door switch. Correct/proceed accordingly. - Check BCM for trouble codes. Correct/proceed accordingly. 3. If power locks still do not function do the following: - Remove latch from door cavity. - Connect latch to electrical connector outside the door. - Function power lock/unlatch switch in both latch and unlatch directions. Watch for lock/unlatch lever on latch to move completely from one position to the other. - If lever does not move, remove connector from old latch and attach to new latch outside of door cavity. - Verify new latch is functional, if so, attach rods and install new latch in door. Did you find and correct the condition?		
15	If the key cylinder is loose do the following: - Remove the trim if necessary. - Check that the retaining clip is properly seated. (if equipped) - Check that the fastener is properly torqued. (if equipped) Did you find and correct the condition?	Go to Step 18	Go to Step 16
16	The outside key cylinder will not latch and unlatch the latch and function smoothly without binding: - For cold weather freezing, thaw as necessary - Remove trim if required. - Check that the key cylinder rod is securely attached both to the key cylinder pawl and the	Go to Step 18	Go to Step 17

Step	Action	Yes	No
	latch. 4. Check that key cylinder lever, rod and latch lever are free of interferences. Remove interferences as required. 5. Check that latch cylinder rod is routed properly. Re-route as required. 6. Remove rod from latch cylinder and actuate cylinder. Check for internal resistance. Lubricate latch cylinder as required 7. Verify Cylinder rotates with vehicle key. If not, code and replace cylinder to match vehicle key. See latch cylinder coding and replacing. Did you find and correct the condition?		
17	The door is difficult to open: • Check for interference with the fender, adjacent door, body opening or door striker and adjust as necessary. • Check for binding door hinges. Lubricate or align/adjust as necessary. • Check the door check link for binding. Lubricate as necessary. • Adjust the door as necessary. Did you find and correct the condition?	Go to Step 18	Go to appropriate Door Lock Striker Adjustment procedure.
18	Verify proper operation of the door closing system. • Outside handle • Inside handle • Manual lock/unlatch • Outside key cylinder • Inside latch knob • Double pull handle • Power lock/unlatch • Key fob • Door switches • Door opening/closing effort Is the condition still present?	Go to Step 1	System OK

REPAIR INSTRUCTIONS

FUEL TANK FILLER DOOR LOCK ACTUATOR REPLACEMENT

Fig. 6: Fuel Tank Filler Door Lock Actuator
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Fuel Tank Filler Pipe Housing. Refer to Fuel Tank Filler Pipe Housing Replacement .	
1	Fuel Tank Filler Door Lock Actuator
	Procedure 1. Disconnect the electrical connector. 2. Remove the actuator rod from the actuator shaft, with light pressure, pressing sideways on the rod at the shafts end, and rotating the rod outward from the housing. 3. Release the 3 retainers while using light outward pressure on the actuator.

FRONT SIDE DOOR INSIDE HANDLE CABLE REPLACEMENT

Fig. 7: Side Door Inside Handle Cable & Access Cover

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front side door latch and handle bracket assembly from the door. Refer to Front Side Door Latch Replacement .	
1	Front Side Door Inside Handle Cable Access Cover Procedure 1. Use a suitable tool, open the access cover to view the cable end. 2. Release the cable end from the latch assembly.
2	Front Side Door Inside Handle Cable NOTE: Ensure that the door lock system operates properly before installing the trim.

REAR SIDE DOOR INSIDE HANDLE CABLE REPLACEMENT

Fig. 8: Side Door Inside Handle Cable & Access Cover
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the rear side door latch and handle bracket assembly from the door. Refer to Rear Side Door Latch Replacement .	
1	Rear Side Door Inside Handle Cable Cover Procedure 1. Use a suitable tool, open the access cover to view the cable end. 2. Release the cable end from the latch assembly.
2	Rear Side Door Inside Handle Cable NOTE: Ensure that the door lock system operates properly before installing the

Callout	Component Name
	trim.

FRONT SIDE DOOR LOCK CYLINDER REPLACEMENT

Removal Procedure

NOTE: When performing this procedure the latch and handle bracket assembly Must be removed from the vehicle to replace the door lock cylinder assembly.

1. Remove Front Side Door Latch. Refer to [Front Side Door Latch Replacement](#)

Fig. 9: Front Side Door Lock Cylinder Rod

Courtesy of GENERAL MOTORS COMPANY

NOTE: Its not necessary to disconnect the inside or outside handle cables to replace the door lock cylinder.

2. Remove Front Side Door Lock Cylinder Rod (1) @ Front Side Door Lock Cylinder.

Fig. 10: Lock Cylinder Retainers

Courtesy of GENERAL MOTORS COMPANY

3. From the back side of the outside handle bracket, use a suitable tool, push up and down on the lock cylinder retainers (1) releasing the retainer from the cylinder (2).

Fig. 11: Lock Cylinder Retainer, Lock Cylinder And Handle Bracket

Courtesy of GENERAL MOTORS COMPANY

4. With the lock cylinder retainer (1) removed, pull the lock cylinder (2) rearward releasing it from the handle bracket (3).

Installation Procedure

Fig. 12: Lock Cylinder Retainer, Lock Cylinder And Handle Bracket

Courtesy of GENERAL MOTORS COMPANY

NOTE: Ensure that the door lock cylinder is engage all the way into the side door handle locator tabs. Insert the key into the door lock cylinder, turn left to right checking for binding before install the assembly to the vehicle.

1. Install the lock cylinder retainer (1) to the front side door outside handle bracket assembly (3).
2. Install the door lock cylinder (2) in the front side door outside handle bracket, push forward locking the lock cylinder (2) into the lock cylinder retainer.

Fig. 13: Front Side Door Lock Cylinder Rod

Courtesy of GENERAL MOTORS COMPANY

3. Install Front Side Door Lock Cylinder Rod (1) @ Front Side Door Lock Cylinder.
4. Install Front Side Door Latch. Refer to [Front Side Door Latch Replacement](#)
5. Ensure that the door lock system operates properly before installing the trim.

OPENING THE LIFTGATE WITHOUT ELECTRICAL POWER

Fig. 14: Liftgate Latch Release Adapter Hole Plug And Liftgate Latch
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Liftgate Latch Release Adapter Hole Plug
2	Liftgate Latch Procedure Insert a flat bladed service type tool into the square hole and turn it clockwise until the primary latch releases. NOTE: Rotation to release latch should be approximately 30 degrees. Excessive rotation can cause damage to the latch.

FRONT SIDE DOOR OUTSIDE HANDLE REPLACEMENT (BASE)

Removal Procedure

Fig. 15: Cover Cap

Courtesy of GENERAL MOTORS COMPANY

NOTE: **USE HAND TOOL ONLY.** Using a battery operated gun or power tool can **BREAK** the door handle bracket.

1. Remove the cover cap that conceals the screw (1) from the inside edge of the door.

Using a small flat-bladed tool, release the cover cap from the door.

Fig. 16: Securing Door Outside Handle In Pulled Position

Courtesy of GENERAL MOTORS COMPANY

NOTE: The door outside handle (2) must now be secured in the pulled position.

2. Remove the door handle from the door.

1. Pull the door handle (2) outwards and hold.

NOTE: USE HAND TOOL ONLY. DO NOT TURN THE SCREW PAST 12.5 ROTATIONS TOTAL, this will break the door handle bracket.

2. While holding handle (2) in the full open position, using a manual screwdriver loosen the screw (1) TEN full turns. The handle (2) will stay in the full open position without being held.

Fig. 17: Bezel And Cylinder/Cover

Courtesy of GENERAL MOTORS COMPANY

3. Remove the bezel with cylinder/cover and blank cylinder (1) from the door. If unable to remove the bezel, complete one full turn of the screw at a time until bezel can be released. DO NOT TURN MORE THAN 2.5 ROTATIONS.

Fig. 18: Side Door Outside Handle Removal Procedure
Courtesy of GENERAL MOTORS COMPANY

3. Remove the door handle (1) from the door as follows:
 1. Slide the door handle rearward releasing it from the door handle bracket.
 2. Open the door handle fully.

3. Remove the door handle from the door.

Installation Procedure

Fig. 19: Side Door Outside Handle Installation Procedure
Courtesy of GENERAL MOTORS COMPANY

1. Install the door handle (1) to the door (2) as follows:
 1. Insert the door handle into the door handle pocket.
 2. Slide the door handle forward securing it into the door handle bracket.

Fig. 20: Bezel And Cylinder/Cover Installation Procedure

Courtesy of GENERAL MOTORS COMPANY

NOTE: Handle will snap back to flush condition, continue to turn the fastener in the clockwise (right) direction until proper torque is reached.

2. Install the bezel with cylinder/cover and blank cylinder (1) in the door.

Hold the bezel or cover flush to the door sheet metal and turn the cylinder clamp screw (2) until proper torque is reached.

3. Tighten the screw to 6 N.m (53 lb in).

Fig. 21: Cover Cap

Courtesy of GENERAL MOTORS COMPANY

4. Install the cover cap that conceals the screw (1) to the inside edge of the door.
5. Ensure that the door lock system operates properly.

FRONT SIDE DOOR OUTSIDE HANDLE REPLACEMENT (PASS KEY ENTRY ATH)

Special Tools

BO 51363 Door Handle Spring Retainer

Removal Procedure

1. Remove the front side door armrest bracket. Refer to [Front Side Door Armrest Bracket Replacement](#) .
2. Remove the door water deflector.
3. Place the window in the full up position.
4. Disconnect the electrical connector from the door handle for the pass key entry (ATH).

NOTE: USE HAND TOOL ONLY. Using a battery operated gun or power tool can BREAK the door handle bracket.

When removing the door lock cylinder screw Do Not go past the hard stop.

5. Loosen the screw for the front side door lock cylinder opening cover. Refer to [Front Side Door Lock Cylinder Opening Cover Replacement](#).

Fig. 22: Front Side Door Outside Handle And Door Handle Spring Retainer
Courtesy of GENERAL MOTORS COMPANY

6. Pull front side door outside handle (1) outward and insert **BO-51363** Door Handle Spring Retainer over the lock cylinder (2) and under door handle (1).
7. Press rear part of **BO-51363** Door Handle Spring Retainer towards the door. The front side door outside handle (1) should now be held in the extended position.
8. Release pressure on **BO-51363** Door Handle Spring Retainer which allows front side door outside handle (1) to slightly retract.

Fig. 23: Front Side Door Outside Handle & Mechanism

Courtesy of GENERAL MOTORS COMPANY

9. Slide front side door outside handle (1) rearward and then pull outward releasing outside door handle from front side door handle mechanism (2).

Fig. 24: Front Side Door Outside Handle At 90 Degrees

Courtesy of GENERAL MOTORS COMPANY

10. Pull front side door outside handle (1) forward until door handle is approximately at a 90 degree angle to door (2).

Fig. 25: Removing Front Side Door Outside Handle

Courtesy of GENERAL MOTORS COMPANY

11. Gentle pull front side door outside handle (1) outward and remove from door (2).

Fig. 26: Hooked Pick Tool And Door Handle Mechanism

Courtesy of GENERAL MOTORS COMPANY

NOTE:

- It is NOT necessary to remove the door panel if the BO-51363 Door Handle Spring Retainer slips off of the door handle mechanism.
- DO NOT hook the outer parts of the door handle mechanism. The hooked pick tool or equivalent tool could slip off and damage the front door.

12. If **BO-51363** Door Handle Spring Retainer slips off of door handle mechanism during repair, use a hooked pick tool (1) or equivalent to access the handle mechanism.

Fig. 27: Door Handle Spring Retainer And Hooked Pick Tool

Courtesy of GENERAL MOTORS COMPANY

13. Pull door handle mechanism outward to the open position and reinstall **BO-51363** Door Handle Spring Retainer into door handle mechanism. The hooked pick tool (1) or equivalent tool can then be removed.

Installation Procedure

Fig. 28: Front Side Door Outside Handle At 90 Degrees

Courtesy of GENERAL MOTORS COMPANY

1. While holding **BO-51363** Door Handle Spring Retainer in place, install front side door outside handle (1) into door (2) at approximately a 90 degree angle to door.

Fig. 29: Front Side Door Outside Handle & Mechanism

Courtesy of GENERAL MOTORS COMPANY

2. Rotate front side door outside handle (1) rearward into front side door handle mechanism (2).

Fig. 30: Front Side Door Outside Handle

Courtesy of GENERAL MOTORS COMPANY

3. Slide front side door outside handle (1) forward to lock into position.

Fig. 31: Front Side Door Outside Handle & Spring Retainer

Courtesy of GENERAL MOTORS COMPANY

4. Release pressure on **BO-51363** Door Handle Spring Retainer. Pull front side door outside handle (1) outward and remove **BO-51363** Door Handle Spring Retainer from door (2).
5. Tighten the screw for the front side door lock cylinder opening cover. Refer to [**Front Side Door Lock Cylinder Opening Cover Replacement**](#).
6. Connect the electrical connector at the door handle for the pass key entry (ATH).
7. Install the door water deflector.
8. Install the front side door armrest bracket. Refer to [**Front Side Door Armrest Bracket Replacement**](#).
9. Ensure that the door lock system operates properly.

FRONT SIDE DOOR OUTSIDE HANDLE BRACKET REPLACEMENT (DRIVER SIDE)

Removal Procedure

1. Remove Front Side Door Window Channel Retainer. Refer to [**Front Side Door Window Channel Retainer Replacement**](#)
2. Remove Front Side Door Lock Cylinder Opening Cover. Refer to [**Front Side Door Lock Cylinder**](#)

Opening Cover Replacement

3. Remove Front Side Door Outside Handle. Refer to [Front Side Door Outside Handle Replacement \(Base\)](#)[Front Side Door Outside Handle Replacement \(Pass Key Entry ATH\)](#)

Fig. 32: Front Side Door Outside Handle Bracket Screw
Courtesy of GENERAL MOTORS COMPANY

4. Remove Front side door outside handle bracket screw (1)

Fig. 33: Front Side Door Lock Rod And Front Side Door Lock Cylinder
Courtesy of GENERAL MOTORS COMPANY

5. Remove Front Side Door Lock Rod (1) @ Front Side Door Lock Cylinder (2)

Fig. 34: Side Door Outside Handle Bracket
 Courtesy of GENERAL MOTORS COMPANY

6. Lower down the front side door outside handle bracket (1) to the inside door opening.

Fig. 35: Side Door Outside Cable And Retainers
 Courtesy of GENERAL MOTORS COMPANY

7. Remove Front side door outside cable (1) @ retainers (2)

Fig. 36: Side Door Outside Handle Bracket Cable And Counter Balance
 Courtesy of GENERAL MOTORS COMPANY

8. Remove Front side door outside handle bracket cable (1) @ counter balance (2)

Installation Procedure

1. Transfer the lock cylinder.

NOTE: It may be necessary to transfer the wire harness retainers from the old handle bracket.

Fig. 37: Side Door Outside Handle Bracket, Counter Balance And Bracket Clip
 Courtesy of GENERAL MOTORS COMPANY

2. Reset the front side door outside handle bracket counter balance as follows:
 1. The outside door handle Can Not be install until the counter balance is reset.
 2. Grasp the front side door outside handle bracket (1) with one hand.

3. From the back side of the counter balance (2) push forward on the counter balance until it can be held in place using the bracket clip (3).

Fig. 38: Side Door Outside Handle Bracket Cable And Counter Balance
Courtesy of GENERAL MOTORS COMPANY

3. Install Front side door outside handle bracket cable (1) @ counter balance (2)

Fig. 39: Side Door Outside Cable And Retainers
Courtesy of GENERAL MOTORS COMPANY

4. Install Front side door outside cable (1) @ retainers (2)

Fig. 40: Front Side Door Lock Rod And Front Side Door Lock Cylinder
 Courtesy of GENERAL MOTORS COMPANY

5. Install Front Side Door Lock Rod (1) @ Front Side Door Lock Cylinder (2)

Fig. 41: Side Door Outside Handle Bracket
 Courtesy of GENERAL MOTORS COMPANY

6. Raise the front side door outside handle bracket (1) up to the outside door opening.

Fig. 42: Front Side Door Outside Handle Bracket Screw

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Fastener Caution](#) .

7. Install and tighten Front side door outside handle bracket screw (1) to 5 N.m (44 lb in)

NOTE:

- Ensure that the counter balance is reset and locked in the detent of the handle bracket. The counter balance Can Not be reset after the handle bracket has been reinstalled in the door.
- Bracket should be slid full rearward prior to tightening bracket screw.

8.

9. Install Front Side Door Lock Cylinder Opening Cover. Refer to [Front Side Door Lock Cylinder Opening Cover Replacement](#)

10. Install Front Side Door Outside Handle. Refer to [Front Side Door Outside Handle Replacement \(Base\)](#)[Front Side Door Outside Handle Replacement \(Pass Key Entry ATH\)](#)

11. Install Front Side Door Window Channel Retainer. Refer to [Front Side Door Window Channel Retainer Replacement](#)

12. Ensure the door system operates properly.

FRONT SIDE DOOR OUTSIDE HANDLE BRACKET REPLACEMENT (PASSENGER SIDE)

Removal Procedure

1. Remove Front Side Door Window Channel Retainer. Refer to [Front Side Door Window Channel Retainer Replacement](#)

2. Remove Front Side Door Lock Cylinder Opening Cover. Refer to [Front Side Door Lock Cylinder Opening Cover Replacement](#)

3. Remove Front Side Door Outside Handle. Refer to [Front Side Door Outside Handle Replacement \(Base\)](#)[Front Side Door Outside Handle Replacement \(Pass Key Entry ATH\)](#)

Fig. 43: Side Door Outside Handle Bracket Screw
 Courtesy of GENERAL MOTORS COMPANY

4. Remove Front side door outside handle bracket screw (1)

Fig. 44: Side Door Outside Handle Bracket
 Courtesy of GENERAL MOTORS COMPANY

5. Lower the front side door outside handle bracket (1) to the inside door opening.

Fig. 45: Side Door Outside Cable And Retainers

Courtesy of GENERAL MOTORS COMPANY

6. Remove Front side door outside cable (1) @ retainers (2)

Fig. 46: Side Door Outside Handle Bracket Cable And Counter Balance

 Courtesy of GENERAL MOTORS COMPANY

3. Install Front side door outside cable (1) @ retainers (2)

Fig. 50: Side Door Outside Handle Bracket
 Courtesy of GENERAL MOTORS COMPANY

4. Raise the front side door outside handle bracket (1) up to the outside door opening.

Fig. 51: Side Door Outside Handle Bracket Screw

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Fastener Caution](#) .

5. Install and tighten Front side door outside handle bracket screw (1) to 5 N.m (44 lb in)

NOTE:

- Ensure that the counter balance is reset and locked in the detent of the handle bracket. The counter balance Can Not be reset after the handle bracket has been reinstalled in the door.
- Bracket should be slid full rearward prior to tightening bracket screw.

6. Install Front Side Door Lock Cylinder Opening Cover. Refer to [Front Side Door Lock Cylinder Opening Cover Replacement](#)

7. Install Front Side Door Outside Handle. Refer to [Front Side Door Outside Handle Replacement \(Base\)](#)[Front Side Door Outside Handle Replacement \(Pass Key Entry ATH\)](#)

8. Install Front Side Door Window Channel Retainer. Refer to [Front Side Door Window Channel Retainer Replacement](#)

9. Ensure the door system operates properly.

FRONT SIDE DOOR OUTSIDE HANDLE CABLE REPLACEMENT

Fig. 52: Side Door Outside Handle Cable

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front side door latch and handle bracket assembly from the door. Refer to Front Side Door Latch Replacement .	
1	Front Side Door Outside Handle Cable Procedure 1. Remove the front side door outside handle cable from the retainers. 2. Release the cable from the back of the latch assembly. 3. Remove the front side door outside handle cable from the front side door outside handle bracket. NOTE: Ensure that the door lock system operates properly before installing the trim.

REAR SIDE DOOR OUTSIDE HANDLE BRACKET REPLACEMENT

Removal Procedure

1. Remove Rear Side Door Window Channel Rear Retainer. Refer to [Rear Side Door Window Channel Rear Retainer Replacement](#)
2. Remove Rear Side Door Lock Cylinder Opening Cover. Refer to [Rear Side Door Lock Cylinder Opening Cover Replacement](#)
3. Remove Rear Side Door Outside Handle. Refer to [Rear Side Door Outside Handle Replacement](#)

Fig. 53: Side Door Outside Handle Bracket Screw
Courtesy of GENERAL MOTORS COMPANY

4. Remove Rear side door outside handle bracket screw (1)

Fig. 54: Side Door Outside Handle Bracket
Courtesy of GENERAL MOTORS COMPANY

5. Lower the rear side door outside handle bracket (1) down to the inside door opening.

Fig. 55: Side Door Outside Cable And Retainers

Courtesy of GENERAL MOTORS COMPANY

6. Remove Rear side door outside cable (1) @ retainers (2)

Fig. 56: Side Door Outside Handle Bracket Cable And Counter Balance

Courtesy of GENERAL MOTORS COMPANY

7. Remove Rear side door outside handle bracket cable (1) @ counter balance (2)

Installation Procedure

NOTE: It may be necessary to transfer the wire harness retainers from the old handle bracket.

Fig. 57: Side Door Outside Handle Bracket, Counter Balance And Bracket Clip
Courtesy of GENERAL MOTORS COMPANY

1. Reset the rear side door outside handle bracket counter balance as follows:
 1. The outside door handle Can Not be install until the counter balance is reset.
 2. Grasp the rear side door outside handle bracket (1) with one hand.
 3. From the back side of the counter balance (2) push forward on the counter balance until it can be held in place using the bracket clip (3).

2. Install Rear side door outside handle bracket cable (1) @ counter balance (2)

Fig. 59: Side Door Outside Cable And Retainers
Courtesy of GENERAL MOTORS COMPANY

3. Install Rear side door outside cable (1) @ retainers (2)

Fig. 60: Side Door Outside Handle Bracket
Courtesy of GENERAL MOTORS COMPANY

4. Raise the rear side door outside handle bracket (1) up to the outside door opening.

Fig. 61: Side Door Outside Handle Bracket Screw

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Fastener Caution](#) .

5. Install and tighten Rear side door outside handle bracket screw (1) to 5 N.m (44 lb in)

NOTE:

- Ensure that the counter balance is reset and locked in the detent of the handle bracket. The counter balance Can Not be reset after the handle bracket has been reinstalled in the door.
- Bracket should be slid full rearward prior to tightening bracket screw.

6. Install Rear Side Door Lock Cylinder Opening Cover. Refer to [Rear Side Door Lock Cylinder Opening Cover Replacement](#)
7. Install Rear Side Door Outside Handle. Refer to [Rear Side Door Outside Handle Replacement](#)
8. Install Rear Side Door Window Channel Rear Retainer. Refer to [Rear Side Door Window Channel Rear Retainer Replacement](#)
9. Ensure the door system operates properly.

LIFTGATE OUTSIDE HANDLE REPLACEMENT

Fig. 62: Liftgate Outside Handle
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Liftgate Lower Trim Finish Panel. Refer to Liftgate Lower Trim Finish Panel Replacement .	
1	Liftgate Outside Handle Bolt Cap (Qty: 2)
2	Liftgate Outside Handle Bolt (Qty: 2) CAUTION: Refer to Fastener Caution . Tighten 2.5 N.m (22 lb in)
3	Liftgate Outside Handle Procedure 1. Release the retainers. 2. Disconnect the electrical connector. 3. Transfer components as necessary.

LIFTGATE LATCH REPLACEMENT

Fig. 63: Liftgate Latch
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Liftgate Lower Trim Finish Panel. Refer to Liftgate Lower Trim Finish Panel Replacement	
1	Liftgate Latch Bolt (Qty: 2) CAUTION: Refer to Fastener Caution . Tighten 22 N.m (16 lb ft)
2	Liftgate Latch Procedure Disconnect the electrical connector.

REAR SIDE DOOR OUTSIDE HANDLE REPLACEMENT

Fig. 64: Rear Side Door Outside Handle

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove Rear Side Door Lock Cylinder Opening Cover. Refer to Rear Side Door Lock Cylinder Opening Cover Replacement 2. Remove Rear Side Door Trim. Refer to Rear Side Door Trim Replacement 3. Remove the rear side door water deflector. 4. Disconnect the electrical connector.	
1	Rear Side Door Outside Handle 1. Pull the rear side door outside handle outward and hold it in the open position. 2. Slide the rear side door outside handle rearward and then outwards in a swinging motion releasing the handle from the rear side door outside handle bracket. 3. Install the rear side door outside handle into the handle bracket. 4. While screwing in the screw for the lock cylinder opening cover, hold the handle in the open position, this will avoid the door handle from snapping once the spring pressure is relieved and the door handle returns to the close position.

REAR SIDE DOOR OUTSIDE HANDLE CABLE REPLACEMENT

Fig. 65: Rear Side Door Outside Handle Cable
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the rear side door latch and handle bracket assembly from the door. Refer to Rear Side Door Latch Replacement .	
1	Rear Side Door Outside Handle Cable Procedure 1. Remove the rear side door outside handle cable from the retainers. Do not remove the inside door handle cable from the latch. 2. Release the cable from the back of the latch assembly. 3. Unhook the cable from the handle bracket. NOTE: Ensure that the door lock system operates properly before installing the trim.

FRONT SIDE DOOR LATCH REPLACEMENT

Removal Procedure

1. Remove Front Side Door Window Channel Retainer. Refer to [Front Side Door Window Channel Retainer Replacement](#)

NOTE: Disconnect the window from the window regulator, place the window in the full up position, use masking tape to tape the window to the upper door frame.

2. Remove Front Side Door Window Regulator. Refer to [Front Side Door Window Regulator Replacement](#)
3. Remove Front Side Door Outside Handle Bracket. Refer to [Front Side Door Outside Handle Bracket Replacement \(Driver Side\)](#)[Front Side Door Outside Handle Bracket Replacement \(Passenger Side\)](#)
4. Remove Front Side Door Locking Rod Knob. Refer to [Front Side Door Locking Rod Knob Replacement](#)
5. Disconnect the electrical connector.

Fig. 66: Four Fasteners

Courtesy of GENERAL MOTORS COMPANY

6. Remove Four bolts (1) @ the Front Side Door Latch

Fig. 67: Front Door Outside Handle Bracket And Front Side Door Latch
Courtesy of GENERAL MOTORS COMPANY

7. Remove Front Door Outside Handle Bracket (1) @ the Front Side Door Latch (2)
8. Remove Front Side Door Outside Handle Cable. Refer to [Front Side Door Outside Handle Cable Replacement](#)
9. Remove Front Side Door Inside Handle Cable. Refer to [Front Side Door Inside Handle Cable Replacement](#)

Installation Procedure

1. Install Front Side Door Inside Handle Cable. Refer to [Front Side Door Inside Handle Cable Replacement](#)
2. Install Front Side Door Outside Handle Cable. Refer to [Front Side Door Outside Handle Cable Replacement](#)
3. Transfer components as necessary.

Fig. 68: Front Door Outside Handle Bracket And Front Side Door Latch

Courtesy of GENERAL MOTORS COMPANY

4. Install Front Door Outside Handle Bracket (1) @ the Front Side Door Latch (2)

Fig. 69: Four Fasteners

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Fastener Caution](#)

NOTE: Install and torque the four latch bolts in proper sequence to prevent damage to the latch mechanism.

5. Install and tighten Four bolts (1) @ the Front Side Door Latch to 11 N.m (97 lb in)
6. Install Front Side Door Locking Rod Knob. Refer to [Front Side Door Locking Rod Knob Replacement](#)
7. Install Front Side Door Outside Handle Bracket. Refer to [Front Side Door Outside Handle Bracket Replacement \(Driver Side\)](#)[Front Side Door Outside Handle Bracket Replacement \(Passenger Side\)](#)
8. Install Front Side Door Window Regulator. Refer to [Front Side Door Window Regulator Replacement](#)
9. Install Front Side Door Window Channel Retainer. Refer to [Front Side Door Window Channel Retainer Replacement](#)
10. Connect the electrical connector.
11. Inspect the door latch and outside handle for proper operation before installing the door trim.
12. Remove the tape from the front side door window and frame.

REAR SIDE DOOR LATCH REPLACEMENT

Removal Procedure

1. Remove Rear Side Door Window Channel Rear Retainer. Refer to [Rear Side Door Window Channel Rear Retainer Replacement](#)

NOTE: Disconnect the window from the window regulator, place the window in the full up position, use masking tape to tape the window to the upper

door frame.

2. Remove Rear Side Door Window Regulator. Refer to [Rear Side Door Window Regulator Replacement](#)
3. Remove Rear Side Door Outside Handle Bracket. Refer to [Rear Side Door Outside Handle Bracket Replacement](#)
4. Remove Rear Side Door Locking Rod Knob. Refer to [Rear Side Door Locking Rod Knob Replacement](#)
5. Disconnect the electrical connector.

Fig. 70: Rear Side Door Latch Bolts

Courtesy of GENERAL MOTORS COMPANY

6. Remove Rear Side Door Latch Bolts (1) (Qty: 4)

Fig. 71: Rear Door Outside Handle Bracket And Rear Side Door Latch

Courtesy of GENERAL MOTORS COMPANY

7. Remove Rear Door Outside Handle (1) @ the Rear Side Door Latch (2)
8. Remove Rear Side Door Outside Handle Cable. Refer to [Rear Side Door Outside Handle Cable Replacement](#)
9. Remove Rear Side Door Inside Handle Cable. Refer to [Rear Side Door Inside Handle Cable Replacement](#)

Installation Procedure

1. Install Rear Side Door Inside Handle Cable. Refer to [Rear Side Door Inside Handle Cable Replacement](#)
2. Install Rear Side Door Outside Handle Cable. Refer to [Rear Side Door Outside Handle Cable Replacement](#)
3. Transfer components as necessary.

Fig. 72: Rear Side Door Outside Handle Bracket And Rear Side Door Latch

Courtesy of GENERAL MOTORS COMPANY

4. Install Rear Side Door Outside Handle Bracket (1) @ the Rear Side Door Latch (2)

Fig. 73: Rear Side Door Latch Bolts

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Fastener Caution](#)

NOTE: Install and torque the four latch bolts in proper sequence to prevent damage to the latch mechanism.

5. Install and tighten Rear Side Door Latch Bolts (1) (Qty: 4) to 11 N.m (97 lb in)
6. Install Rear Side Door Locking Rod Knob. Refer to [Rear Side Door Locking Rod Knob Replacement](#)
7. Install Rear Side Door Outside Handle Bracket. Refer to [Rear Side Door Outside Handle Bracket Replacement](#)
8. Install Rear Side Door Window Regulator. Refer to [Rear Side Door Window Regulator Replacement](#)
9. Install Rear Side Door Window Channel Rear Retainer. Refer to [Rear Side Door Window Channel Rear Retainer Replacement](#)
10. Connect the electrical connector.
11. Inspect the door latch and outside handle for proper operation before installing the door trim.
12. Remove the tape from the rear side door window and frame.

FRONT SIDE DOOR LOCK CYLINDER OPENING COVER REPLACEMENT

Fig. 74: Passenger Side Door Lock Cylinder Opening Cover (Front)

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Passenger Side Door Inner Panel Hole Plug Procedure Using the appropriate tool, remove the cap that conceals the screw from the inside of the door opening.
2	Passenger Side Door Lock Cylinder Opening Cover Screw CAUTION: Refer to Fastener Caution . NOTE: USE HAND TOOL ONLY. Using a battery operated gun or power tool can BREAK the component.

Callout	Component Name
	Turn screw out until lock cylinder cover can be removed. DO NOT go passed the hard stop. Tighten 4.7 N.m (42 lb in)
3	Passenger Side Door Lock Cylinder Opening Cover Procedure 1. Pull the passenger side door outside handle outward to release the door lock cylinder opening cover. 2. Pull the lock cylinder opening cover from the door.

REAR SIDE DOOR LOCK CYLINDER OPENING COVER REPLACEMENT

Fig. 75: Rear Side Door Lock Cylinder Opening Cover
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear Side Door Inner Panel Hole Plug Procedure Using the appropriate tool, remove the cap that conceals the screw from the inside of the door opening.
2	Rear Side Door Lock Cylinder Opening Cover Screw CAUTION: Refer to Fastener Caution . NOTE: USE HAND TOOL ONLY. Using a battery operated gun or power tool can BREAK the component. Turn screw out until lock cylinder cover can be removed. DO NOT go passed the hard stop. Tighten 4.7 N.m (42 lb in)
3	Rear Side Door Lock Cylinder Opening Cover Procedure 1. Pull the rear side door outside handle outward to release the door lock cylinder opening cover. 2. Pull the lock cylinder opening cover from the door.

FRONT SIDE DOOR LOCKING ROD REPLACEMENT

Fig. 76: Front Side Door Locking Rod

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front side door trim. Refer to Front Side Door Trim Replacement .	
1	Front Side Door Locking Rod Clip Procedure Release the locking rod from the clip.
2	Front Side Door Locking Rod Procedure Turn the locking rod downward, pull outward while turning, releasing it from the latch. NOTE: Ensure that the door lock system operates properly before installing the trim.

FRONT SIDE DOOR LOCKING ROD CLIP REPLACEMENT

Fig. 77: Front Side Door Locking Rod Clip
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front side door trim. Refer to Front Side Door Trim Replacement .	
1	Front Side Door Locking Rod Knob Procedure Separate the front side door locking rod knob from the clip and move to the side.
2	Front Side Door Locking Rod Clip Procedure Turn the front side door locking rod clip 180 degrees and pull from the door. NOTE: Inspect the front side door lock for proper operating before installing the door trim.

FRONT SIDE DOOR LOCKING ROD KNOB REPLACEMENT

Fig. 78: Front Side Door Locking Rod Knob
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front side door trim. Refer to Front Side Door Trim Replacement .	
1	Front Side Door Locking Rod Clip Procedure Release the locking rod from the clip.
2	Front Side Door Locking Rod Procedure Turn the locking rod downward, pull outward while turning, releasing it from the latch. NOTE: Ensure that the door lock system operates properly before installing the trim.

FRONT SIDE DOOR LOCK CYLINDER ROD REPLACEMENT

Fig. 79: Front Side Door Lock Cylinder Rod
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front side door latch and handle bracket assembly from the door. Refer to Front Side Door Latch Replacement .	
1	Front Side Door Lock Cylinder Rod Procedure 1. Remove the front side door lock cylinder rod from the lock cylinder by turning the housing bracket clockwise. 2. Release the lock cylinder rod from the latch only, do not remove the handle cables from the latch. NOTE: Ensure that the door lock system operates properly before installing the trim.

FRONT SIDE DOOR OUTSIDE HANDLE CABLE RETAINER REPLACEMENT

Fig. 80: Front Side Door Outside Handle Cable Retainer
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Front Side Door Outside Handle Bracket. Refer to Front Side Door Outside Handle Bracket Replacement (Driver Side) Front Side Door Outside Handle Bracket Replacement (Passenger Side)	
1	Front Side Door Outside Handle Cable Retainer (Qty: 3) Procedure Squeeze tab end of retainer and pull retainer from handle bracket.

REAR SIDE DOOR LOCKING ROD KNOB REPLACEMENT

Fig. 81: Rear Side Door Locking Rod Knob

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Rear Side Door Trim. Refer to Rear Side Door Trim Replacement	
1	Rear Side Door Locking Rod Knob Retainer Procedure Release the locking rod knob from the retainer. NOTE: Ensure that the door lock system operates properly before installing the trim.
2	Rear Side Door Locking Rod Knob Procedure Turn the locking rod down, pull upward and turning while releasing it from the latch.

FRONT SIDE DOOR LOCK STRIKER ADJUSTMENT

Fig. 82: Door Lock Striker And Bolts

Courtesy of GENERAL MOTORS COMPANY

NOTE: To determine if the striker adjustment is required, proceed as follows.

1. Ensure that the door is properly aligned with the door opening before proceeding with the striker adjustment.
2. Open and close the door on the striker (2). Note if the door drags on the striker causing the door to move upward or downward upon contact with the striker. Also note the closing effort to fully engage the latch.

Fig. 83: Door Striker Anchor Plate And Door Striker

Courtesy of GENERAL MOTORS COMPANY

3. The striker plate weld nuts (1) are welded in place. Using a soft marker, mark around the striker (2) for reference of the original position. Loosen the striker screws just enough to allow the movement of the door striker and shims if equipped.

Fig. 84: Adjusting Door Striker

Courtesy of GENERAL MOTORS COMPANY

4. Adjust the door striker up or down and inboard or outboard as required.
5. Move the striker to eliminate drag on the striker and door latch and to achieve proper door position within door opening. Start with up/down position, then position the striker to achieve proper alignment to the door opening. Set the in/out adjustment for proper door seal engagement ensuring that the door closing efforts are correct.

CAUTION: Refer to Fastener Caution .

6. Adjust the striker and add spacers as required and tighten the screws to 22 N.m (16 lb ft).
7. Inspect the door for proper operation.
8. Close the door.

FRONT SIDE DOOR LOCK STRIKER REPLACEMENT

Fig. 85: Front Side Door Lock Striker

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Door Lock Striker Screws (Qty: 2) CAUTION: Refer to Fastener Caution . Tighten 22 N.m (16 lb ft)
2	Front Door Lock Striker Procedure Ensure the alignment of the striker. Refer to Front Side Door Lock Striker Adjustment.

LIFTGATE LATCH STRIKER REPLACEMENT

Fig. 86: Liftgate Latch Striker

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Rear End Trim Finish Panel Opening Cover. Refer to Rear End Trim Finish Panel Opening Cover Replacement	
1	Liftgate Latch Striker Bolt (Qty: 2) CAUTION: Refer to Fastener Caution . Tighten 22 N.m (16 lb ft)
2	Liftgate Latch Striker Procedure Mark the location of the striker with a grease pencil to ensure proper alignment during installation.

REAR SIDE DOOR LOCK STRIKER ADJUSTMENT

Fig. 87: Door Lock Striker And Bolts

Courtesy of GENERAL MOTORS COMPANY

NOTE: To determine if the striker adjustment is required, proceed as follows.

1. Ensure that the door is properly aligned with the door opening before proceeding with the striker adjustment.
2. Open and close the door on the striker (2). Note if the door drags on the striker causing the door to move upward or downward upon contact with the striker. Also note the closing effort to fully engage the latch.

Fig. 88: Door Striker Anchor Plate And Door Striker

Courtesy of GENERAL MOTORS COMPANY

3. The striker plate weld nuts (1) are welded in place. Using a soft marker, mark around the striker (2) for reference of the original position. Loosen the striker screws just enough to allow the movement of the door striker and shims if equipped.

Fig. 89: Adjusting Door Striker

Courtesy of GENERAL MOTORS COMPANY

4. Adjust the door striker up or down and inboard or outboard as required.
5. Move the striker to eliminate drag on the striker and door latch and to achieve proper door position within door opening. Start with up/down position, then position the striker to achieve proper alignment to the door opening. Set the in/out adjustment for proper door seal engagement ensuring that the door closing efforts are correct.

CAUTION: Refer to Fastener Caution .

6. Adjust the striker and add spacers as required and tighten the screws to 22 N.m (16 lb ft).
7. Inspect the door for proper operation.
8. Close the door.

REAR SIDE DOOR LOCK STRIKER REPLACEMENT

Callout	Component Name
1	Rear Side Door Lock Striker Screw (Qty: 2) CAUTION: Refer to Fastener Caution . Tighten 22 N.m (16 lb ft)
2	Rear Side Door Lock Striker Procedure Adjust Rear Side Door Lock Striker. Refer to Rear Side Door Lock Striker Adjustment

OPENING THE FUEL TANK FILLER DOOR WHEN THE DOOR LOCK MALFUNCTIONS

1. Remove the right rear wheelhouse panel liner. Refer to [Rear Wheelhouse Liner Replacement](#) .
2. Reach in behind the fuel filler pipe housing and manually slide the actuator rod forward, using light pressure, to override the actuator to release the fuel tank filler door.

FUEL TANK FILLER DOOR LOCK RELEASE SWITCH REPLACEMENT

Fig. 91: Fuel Tank Filler Door Lock Release Switch

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Front Side Door Trim. Refer to Front Side Door Trim Replacement	
1	Fuel Tank Filler Door Lock Release Switch Procedure 1. From the backside of the door trim panel, use a plastic trim tool to gently push in on the side tabs to release the switch from the front side door trim. 2. Disconnect the electrical connector.

LIFTGATE RELEASE SWITCH REPLACEMENT

Fig. 92: Liftgate Release Switch

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Liftgate Outside Handle. Refer to Liftgate Outside Handle Replacement	
1	Liftgate Release Switch Procedure Using a trim type tool, gently push in on the tabs to release the switch.

DOOR LOCK SWITCH REPLACEMENT - DRIVER SIDE

Fig. 93: Door Lock Switch - Driver Side

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Front Side Door Trim. Refer to Front Side Door Trim Replacement	
1	Door Lock Switch Procedure 1. From the backside of the door trim panel, use a plastic trim tool to gently push in on the side tabs to release the switch from the front side door trim. 2. Disconnect the electrical connector. 3. Refer to Control Module References for programming and setup information, if required.

DOOR LOCK SWITCH REPLACEMENT - PASSENGER FRONT

Fig. 94: Door Lock Switch - Passenger Front
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Front Side Door Trim. Refer to Front Side Door Trim Replacement	
1	Door Lock Switch Passenger Front Procedure 1. From the backside of the door trim panel, use a plastic trim tool to gently push in on the side tabs to release the switch from the front side door trim. 2. Disconnect the electrical connector. 3. Refer to Control Module References for programming and setup information, if required.

DESCRIPTION AND OPERATION

CHARGE PORT DOOR DESCRIPTION AND OPERATION

Charge Port System Components

The charge port system consists of the following components:

- Charge port door position sensor
- Hybrid/EV powertrain control module 2

Charge Port Ajar Message

When the vehicle is in the Service Mode or ON, the hybrid/EV powertrain control module 2 supplies a 5V signal to the charge port door position switch through the charge port door sensor signal circuit. The charge port door position switch contains a resistor ladder interface for switch position between two resistors for sensing used by the hybrid/EV powertrain control module 2 to determine if the charge port door is in the open position or the closed position. The hybrid/EV powertrain control module 2 sends a serial data message to the driver information center in the instrument panel cluster to display the Charge Door Open message.

DOOR AJAR INDICATOR DESCRIPTION AND OPERATION

Door Ajar Indicator System Components

The door ajar indicator system consists of the following components:

- Body control module (BCM)
- Instrument cluster
- Driver door latch
- Passenger door latch
- Left rear door latch
- Right rear door latch
- Driver window motor
- Passenger window switch
- Left rear window switch
- Right rear window switch

Fig. 95: Door Ajar Indicator With AXG/AED/AEQ Block Diagram

A23D	A23D Door Latch Assembly - Driver
A23P	A23P Door Latch Assembly - Passenger
A23LR	A23LR Door Latch Assembly - Left Rear
A23RR	A23RR Door Latch Assembly - Right Rear
K9	K9 Body Control Module

Driver Door Ajar

The driver window motor provides a 12V signal to the driver door ajar switch signal circuit. The driver door ajar switch is integral to the driver door latch assembly. When the driver door is opened, the normally open door ajar switch closes. With the door ajar switch closed, ground is provided to the door ajar switch signal circuit and the voltage within the signal circuit drops. The driver window motor will detect the voltage drop and will send a serial data message to the body control module which will then send a message to the instrument panel cluster to command the door ajar message

Passenger Door Ajar

The passenger window switches each provide a 12 V signal to their respective door ajar switch signal circuits. The door ajar switches are integral to each door latch assembly. When a door is opened, the normally open door ajar switch closes. With the door ajar switch closed, ground is provided to the door ajar switch signal circuit and the voltage within the signal circuit drops. The window switches will detect the voltage drop and will send a serial data message to the body control module which will then send a message to the instrument panel cluster to command the door ajar message.

FUEL FILL DOOR DESCRIPTION AND OPERATION

Refueling System Components

The refueling system consists of the following components:

- Refuel request switch
- Fuel door position sensor
- Fuel door latch
- Hybrid powertrain control module 2

Fig. 96: Refueling System Block Diagram

Courtesy of GENERAL MOTORS COMPANY

Refueling System Overview

To effectively manage evaporative fuel emissions, hybrid vehicles with extended electrical range capability must be equipped with a "pressurized" fuel system that can be sealed from atmosphere when the internal combustion engine is not operating.

When the fuel system is sealed, the internal pressure will vary with changes in temperature, such as the natural variation in ambient temperature that occurs throughout the day. To maintain evaporative emissions compliance, vehicle refueling can only be permitted once the fuel system has been adequately vented to atmosphere through the carbon canister. The Refueling Management feature described in this document provides the necessary means to regulate customer access to the fuel cap and manage venting of the fuel system in order to facilitate vehicle refueling without compromising evaporative emissions compliance.

Refueling System Operation

The hybrid/EV powertrain control module 2 monitors the voltage values of the fuel fill door open request wake-up signal circuit and the fuel door request signal circuit. When the refuel request switch is pressed, the two switch contacts close. This provides B+ to the wake-up circuit input and changes the voltage level of the fuel door request signal as it passes through a single resistor instead of 2 resistors. The hybrid/EV powertrain control module 2 will detect the 12 volts on the wake-up circuit and the voltage change on the fuel door request circuit, it will then command the fuel system to vent and sends a serial data message to the driver information center to display the Wait to Refuel message. The hybrid/EV powertrain control module 2 then energizes the fuel door lock/unlock actuator to unlock the fuel door.

After the system has been vented, the hybrid powertrain control module 2 will send a command to unlock the fuel filler door and will send a serial data message to the driver information center to display the Ready To Refuel message. After the vehicle has been refueled, the hybrid powertrain control module 2 will send a serial data message to the driver information center to display the Close Fuel Door message until the fuel filler door is closed. The hybrid powertrain control module 2 will then command the fuel filler door to lock 5 seconds after the fuel filler door is closed or the vehicle speed exceeds 40 km/h (25 mph).

LIFTGATE AJAR INDICATOR DESCRIPTION AND OPERATION

Hatch Open Indicator

The body control module (BCM) monitors the voltage level of the rear hatch ajar signal circuit which is normally at the system voltage when the hatch is closed. When the hatch is ajar or open, a switch within the rear hatch latch closes providing a path to ground for the hatch ajar signal circuit. The voltage within the signal circuit will then drop to 0 volts, the BCM will then detect the voltage drop and will send a serial data message to the instrument panel cluster (IPC). The IPC will then display an icon of the vehicle with the hatch open.

POWER DOOR LOCKS DESCRIPTION AND OPERATION

Door Lock System Components

The power door lock system consists of the following components:

- Driver door lock switch
- Passenger door lock switch
- Key cylinder switch
- Body control module (BCM)
- Driver door latch
- Passenger door latch
- Left rear door latch
- Right rear door latch
- Exterior door handle switches
- Keyless entry control module

Fig. 97: Power Door Locks System Block Diagram

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
S13D	S13D Door Lock Switch - Driver
S13P	S13P Door Lock Switch - Passenger
K9	K9 Body Control Module
A23RR	A23RR Door Latch Assembly - Right Rear
A23LR	A23LR Door Latch Assembly - Left Rear
A23P	A23P Door Latch Assembly - Passenger
A23D	A23D Door Latch Assembly - Driver
K84	K84 Keyless Entry Control Module
B27RR	B27RR Door Handle Switch - Right Rear Exterior
B27LR	B27LR Door Handle Switch - Left Rear Exterior
B27P	B27P Door Handle Switch - Passenger Exterior
B27D	B27D Door Handle Switch - Driver Exterior

Door Lock and Unlock Operation

When the driver or passenger door lock switch is activated in the lock or unlock position, the BCM will receive a ground signal on either the door lock switch lock or unlock signal circuits.

The BCM, upon receipt of a lock switch lock or unlock signal, will supply battery voltage to the door lock actuator lock or unlock control circuits. Since the opposite side of the lock actuator is connected to ground through the other lock actuator control circuit, the doors will then lock or unlock as commanded.

The following three circuits are used to operate the lock:

- Driver door unlock
- Passenger door unlock
- All door lock

The driver door lock actuator is isolated so it can be unlocked by itself using the keyless entry transmitter.

Key Cylinder Switch

The driver window switch monitors the voltage level of the driver door lock motor status signal circuit. When the key is inserted into the driver door key cylinder and turned to the Lock position, a switch within the driver door latch closes causing the voltage to drop within the driver door lock motor status signal circuit. The driver window switch will detect the drop in voltage and will send a serial data message to the BCM commanding all the doors to Lock.

The driver key cylinder switch is used by the customer for programming the keyless entry transmitters. The driver window/outside rearview mirror switch monitors the voltage level of the key switch unlock signal circuit and when it detects a reprogramming request, it will send a serial data message to the body control module.

Passive Door Lock/Unlock Operation

The exterior door handle switch signal circuits provide inputs to the keyless entry control module when the exterior door handle switches are activated. These inputs allow the keyless entry control module to detect a door lock or a door unlock request. The keyless entry control module provides a 12 V signal to each exterior door handle switch via the door handle switch signal circuits. When a door handle switch is pressed, the switch closes and the voltage signal within the signal circuit is pulled to ground. The keyless entry control module will detect the voltage drop and a low frequency antenna will transmit a challenge to the keyless entry transmitter. If the challenge is met, the keyless entry transmitter will respond and the keyless entry control module will send a serial data message to the body control module to command the door(s) to be locked or unlocked

REAR HATCH/GATE DESCRIPTION AND OPERATION

Rear Hatch Release System Components

- Liftgate Latch
- Liftgate Release Switch
- Liftgate Relay
- Body Control Module
- 15 A Fuse

Rear Hatch Release Operation

The rear hatch can be released by placing the transaxle in park, unlocking all the doors and then pressing the touchpad located at the rear of the vehicle above the license plate.

Pressing the touchpad closes a contact providing a ground for the rear closure handle switch open signal circuit. The body control module (BCM) will detect the voltage drop and will pulse 12 V to one side of the relay coil and provide a ground for the other side of the relay coil, this will briefly energize the liftgate relay closing the switch contacts and provide B+ voltage to the liftgate latch. When the doors are locked, the BCM will disable the rear hatch release system by ignoring the liftgate release switch input command and not providing 12 V for the liftgate relay.

1. Windshield Wipers Inoperative 2. Windshield Wipers High Speed Inoperative 3. Windshield Wipers Intermittent or Low Speed Inoperative 4. Windshield Wipers Always ON				

Circuit/System Description

The body control module (BCM) controls the windshield wiper motor based on inputs from the windshield wiper/washer switch, and when intermittent mode is selected, the rain/ambient light sensor module. The BCM monitors the windshield wiper/washer switch through two separate signal circuits and a low reference circuit. The windshield wiper/washer switch utilizes resistive multiplexing to signal a low speed and intermittent operation request to the BCM while a separate discrete signal circuit is used to indicate a high speed wiper request. When the wiper switch is placed in the low speed or intermittent position, the BCM monitors the voltage drop, which changes dependent upon switch position, over an internal pulled high resistor. The BCM will respond by commanding on the low speed or intermittent wipers. With the windshield wiper/washer switch in the high speed position, the BCM's high speed signal circuit is pulled low. The BCM will respond by commanding the windshield wiper motor to operate at high speed via serial data.

Conditions for Running the DTC

- The DTC runs only when a wiper output is actively being requested by the BCM.
- The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

- A short to ground is detected in the front wiper relay control circuit or in the high speed relay control circuit.

Action Taken When the DTC Sets

The BCM will not activate the wiper output.

Conditions for Clearing the DTC

- A current DTC will clear when the condition for setting the fault is no longer present.
- A history DTC will clear after 50 consecutive ignition cycles without a fault present.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle ON.
2. Verify that there are no communications DTCs set.

- **If any communication DTCs are set**

Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

- **If no communication DTCs are set**

3. Verify that DTC B371A is not set.

- **If DTC B371A is set**

Refer to DTC B371A.

- **If DTC B371A is not set**

4. Verify the scan tool Windshield Wiper High Speed Switch parameter changes between Active and Inactive when activating the high speed windshield wipers.

- **If the parameter does not change**

Refer to Circuit/System Testing - Windshield Wiper/Washer Switch Malfunction.

- **If the parameter changes**

5. Verify the scan tool Windshield Wiper Switch parameter changes between Off and Low when activating the low speed windshield wipers.

- **If the parameter does not change**

Refer to Circuit/System Testing - Windshield Wiper/Washer Switch Malfunction.

- **If the parameter changes**

6. Verify the scan tool Windshield Wiper Switch parameter changes between Delay 1 and Delay 5 when cycling the intermittent speed windshield wipers.

- **If the parameter does not change**

Test or replace the S82 Windshield Wiper/Washer Switch.

- **If the parameter changes**

7. Verify the M75 Windshield Wiper Motor changes between Off, Low, and High when cycling the S82 Windshield Wiper/Washer Switch between Off, Low, and High.

- **If the M75 Windshield Wiper Motor does not cycle between Off, Low, and High**

Refer to Circuit/System Testing - Windshield Wiper Motor Malfunction

- **If the M75 Windshield Wiper Motor cycles between Off, Low, and High**

8. All OK.

Circuit/System Testing

Windshield Wiper/Washer Switch Malfunction

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S82 Windshield Wiper/Washer Switch. It may take up to 11 min for all vehicle systems to power down.

2. Test for less than 10 Ω between the low reference circuit terminal 1 and ground.

- **If 10 Ω or greater**

1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module.

2. Test for less than 2 Ω in the low reference circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω , replace the K9 Body Control Module.

- **If less than 10 Ω**

3. Vehicle in Service Mode.

4. Verify the scan tool Windshield Wiper High Speed Switch parameter is Inactive.

- **If not Inactive**

1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module.

2. Test for infinite resistance between the signal circuit terminal 2 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance, replace the K9 Body Control Module.

- **If Inactive**

5. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the low reference circuit terminal 1.

6. Verify the scan tool Windshield Wiper High Speed Switch parameter is Active.

- **If not Active**

1. Vehicle OFF, remove the jumper wire, disconnect the harness connector at the K9 Body Control Module, vehicle in Service Mode.

2. Test for less than 1 V between the signal circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V

3. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K9 Body Control Module.

- **If Active**

7. Test for greater than 8 V between the signal circuit terminal 3 and ground.

- **If less than 8 V**

1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module.

2. Test for infinite resistance between the signal circuit and ground

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K9 Body Control Module.

- **If 8 V or greater**

8. Vehicle OFF, disconnect the X3 harness connector at the K9 Body Control Module, vehicle in Service Mode.

9. Test for less than 1 V between the S82 Windshield Wiper/Washer Switch signal circuit terminal 3 and ground.

- **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

10. Test or replace the S82 Windshield Wiper/Washer Switch.

Windshield Wiper Motor Malfunction

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the M75 Windshield Wiper Motor. It may take up to 2 min for all vehicle systems to power down.

2. Test for less than 10 Ω between the ground circuit terminal 2 and ground.

- **If 10 Ω or greater**

1. Vehicle OFF.
2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is OK and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Vehicle OFF, remove the test lamp.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, M75 Windshield Wiper Motor
 - **If the test lamp illuminates**
5. Connect a test lamp between the control circuit terminal 3 and ground.
6. Verify the test lamp turns ON and OFF when turning the high speed wipers ON and OFF.
 - **If the test lamp is always OFF**
 1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
7. Remove the test lamp.
8. Test for 8 - 9 V between the serial data circuit terminal 4 and ground.
 - **If less than 8 V**

1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module.
2. Test for infinite resistance between the serial data circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the serial data circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
- **If greater than 9 V**
 1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the serial data circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V or greater, replace the K9 Body Control Module.
- **If 8 - 9 V**
9. Test or replace the M75 Windshield Wiper Motor.

Component Testing

Windshield Wiper/Washer Switch

1. Vehicle OFF, disconnect the harness connector at the S82 Windshield Wiper/Washer Switch.
2. Test for infinite resistance between the signal terminal 1 and the low reference terminal 2 with the high speed switch in the open position.
 - **If less than infinite resistance**

Replace the S82 Windshield Wiper/Washer Switch.
 - **If infinite resistance**
3. Test for less than 2 Ω between the signal circuit terminal 1 and the low reference circuit terminal 2 with the high speed switch in the closed position.
 - **If 2 Ω or greater**

Replace the S82 Windshield Wiper/Washer Switch.
 - **If less than 2 Ω**
4. Test for infinite resistance between the signal terminal 3 and the low reference terminal 2 with the low speed switch in the open position.
 - **If less than infinite resistance**

Replace the S82 Windshield Wiper/Washer Switch.
 - **If infinite resistance**
5. Verify the resistance readings are within the specified range listed below between the signal circuit terminal 3 and the low reference circuit terminal 1 by pushing the switch in the listed positions below.

- Delay 1 : 3.75-3.85kΩ
- Delay 2 : 2.75-2.85kΩ
- Delay 3 : 1.95-2.05kΩ
- Delay 4 : 1.25-1.35kΩ
- Delay 5 : 765-775Ω
- **If not within the specified range**

Replace the S82 Windshield Wiper/Washer Switch.

- **If within the specified range**

6. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

DTC B371A: WINDSHIELD WIPER MOTOR INTERNAL MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B371A 39

Windshield Wiper Motor Internal Malfunction

Circuit/System Description

B+ voltage and ground are supplied to the windshield wiper motor. Whenever the vehicle is ON or in Service Mode, the body control module (BCM) sends the wiper/washer switch status through the LIN communication bus. If a fault occurs at any time in the windshield wiper motor, the BCM will set the DTC.

Conditions for Running the DTC

The BCM runs the diagnostic to detect an internal fault when power up is commanded. The only requirements are voltage and ground. This diagnostic runs even if the voltage is out of the valid operating range.

Conditions for Setting the DTC

The BCM receives an invalid signal from the windshield wiper motor.

Action Taken When the DTC Sets

The BCM ignores all additional inputs.

Conditions for Clearing the DTC

A current DTC clears when the diagnostic runs and passes.

DTC B3873: FRONT WASHER RELAY CIRCUIT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC B3873

Front Washer Relay Circuit

For symptom byte information, refer to [Symptom Byte List](#).

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	B3873 02	B3873 04	B3873 01	-

Circuit/System Description

The windshield washer pump is controlled by the body control module (BCM) via a printed circuit board (PCB) relay. When the washer switch is depressed, the BCM's internally pulled high resistor is pulled low by the washer request circuit. The BCM then applies voltage through a control circuit to the PCB windshield washer pump relay. With the relay energized, fused battery voltage is applied through the switch contacts of the relay and the control circuit to activate the windshield washer fluid pump.

Conditions for Running the DTC

- Vehicle ON or in Service Mode
- The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

B3873 01

The body control module detects a short to B+ in the windshield washer pump relay control circuit

B3873 02

The body control module detects a short to ground in the windshield washer pump relay control circuit

B3873 04

The body control module detects an open or high resistance in the windshield washer pump relay control circuit

Action Taken When the DTC Sets

Washer operation is suspended.

Conditions for Clearing the DTC

A current DTC clears when the diagnostic runs and passes.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the G24 Windshield Washer Pump activates when commanding the Windshield Washer Relay On and Off with a scan tool.
 - **If the G24 Windshield Washer Pump does not activate**

Refer to Circuit/System Testing
 - **If the G24 Windshield Washer Pump activates**
3. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify the G24 Windshield Washer Pump is not activated.
 - **If the G24 Windshield Washer Pump is activated**
 1. Vehicle OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood, vehicle in Service Mode.
 2. Test for less than 1 V between the K9 Body Control Module control circuit terminal 14 X4 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the X50A Fuse Block - Underhood.
 - **If the G24 Windshield Washer Pump is not activated**
3. Connect a 10 A fused jumper wire between the control circuit terminal 14 and B+.
4. Verify the G24 Windshield Washer Pump activates.
 - **If the G24 Windshield Washer Pump does not activate**
 1. Vehicle OFF, remove the jumper wire, disconnect the X2 harness connector at the X50A Fuse

Block - Underhood.

2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If less than infinite resistance
3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , test or replace the X50A Fuse Block - Underhood.
- **If the G24 Windshield Washer Pump activates**
5. Replace the K9 Body Control Module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Fuse Block Replacement](#)
- [Control Module References](#) for body control module replacement, programming and setup.

SYMPTOMS - WIPER/WASHER SYSTEMS

NOTE: The following steps must be completed before using the symptom tables:

1. Perform [Diagnostic System Check - Vehicle](#), in order to verify that all of the following conditions are true:
 - No DTCs are set.
 - The control modules can communicate via the serial data link.
2. Refer to [Wiper/Washer System Description and Operation](#) in order to familiarize yourself with the system functions.

Visual/Physical Inspection

- Inspect for aftermarket devices which may affect the operation of the windshield wiper/washer system. Refer to [Checking Aftermarket Accessories](#).
- Inspect the easily accessible or visible system components for obvious damage or conditions which may cause the symptom.
- Inspect the washer fluid reservoir for the proper fluid level.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#).

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [Windshield Wiper System Malfunction](#)
- [Washer Malfunction](#)

WINDSHIELD WIPER SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

Windshield Wiper/Washer Switch Low Reference	-	1	1	-
1. Windshield Wipers Inoperative 2. Windshield Wipers High Speed Inoperative 3. Windshield Wipers Intermittent or Low Speed Inoperative 4. Windshield Wipers Always ON				

Circuit/System Description

The body control module (BCM) controls the windshield wiper motor based on inputs from the windshield wiper/washer switch, and when intermittent mode is selected, the rain/ambient light sensor module. The BCM monitors the windshield wiper/washer switch through two separate signal circuits and a low reference circuit. The windshield wiper/washer switch utilizes resistive multiplexing to signal a low speed and intermittent operation request to the BCM while a separate discrete signal circuit is used to indicate a high speed wiper request. When the wiper switch is placed in the low speed or intermittent position, the BCM monitors the voltage drop, which changes dependent upon switch position, over an internal pulled high resistor. The BCM will respond by commanding on the low speed or intermittent wipers. With the windshield wiper/washer switch in the high speed position, the BCM's high speed signal circuit is pulled low. The BCM will respond by commanding the windshield wiper motor to operate at high speed via serial data.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Vehicle ON.
2. Verify that there are no communications DTCs set.

- **If any communication DTCs are set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

- **If no communication DTCs are set**

3. Verify that DTC B371A is not set.

- **If DTC B371A is set**

Refer to [DTC B371A](#).

- **If DTC B371A is not set**

4. Verify the scan tool Windshield Wiper High Speed Switch parameter changes between Active and Inactive when activating the high speed windshield wipers.

- **If the parameter does not change**

Refer to Circuit/System Testing - Windshield Wiper/Washer Switch Malfunction.

- **If the parameter changes**

5. Verify the scan tool Windshield Wiper Switch parameter changes between Off and Low when activating the low speed windshield wipers.

- **If the parameter does not change**

Refer to Circuit/System Testing - Windshield Wiper/Washer Switch Malfunction.

- **If the parameter changes**

6. Verify the scan tool Windshield Wiper Switch parameter changes between Delay 1 and Delay 5 when cycling the intermittent speed windshield wipers.

- **If the parameter does not change**

Test or replace the S82 Windshield Wiper/Washer Switch.

- **If the parameter changes**

7. Verify the M75 Windshield Wiper Motor changes between Off, Low, and High when cycling the S82 Windshield Wiper/Washer Switch between Off, Low, and High.

- **If the M75 Windshield Wiper Motor does not cycle between Off, Low, and High**

Refer to Circuit/System Testing - Windshield Wiper Motor Malfunction

- **If the M75 Windshield Wiper Motor cycles between Off, Low, and High**

8. All OK.

Circuit/System Testing

Windshield Wiper/Washer Switch Malfunction

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S82 Windshield Wiper/Washer Switch. It may take up to 11 min for all vehicle systems to power down.

2. Test for less than 10 Ω between the low reference circuit terminal 1 and ground.

- **If 10 Ω or greater**

1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module.

2. Test for less than 2 Ω in the low reference circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω , replace the K9 Body Control Module.

- **If less than 10 Ω**

3. Vehicle in Service Mode.

4. Verify the scan tool Windshield Wiper High Speed Switch parameter is Inactive.

- **If not Inactive**

1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module.

2. Test for infinite resistance between the signal circuit terminal 2 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance, replace the K9 Body Control Module.

- **If Inactive**

5. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the low reference circuit terminal 1.

6. Verify the scan tool Windshield Wiper High Speed Switch parameter is Active.

- **If not Active**

1. Vehicle OFF, remove the jumper wire, disconnect the harness connector at the K9 Body Control

Module, vehicle in Service Mode.

2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.

- **If Active**

7. Test for greater than 8 V between the signal circuit terminal 3 and ground.
 - **If less than 8 V**
 1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit and ground
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If 8 V or greater**
8. Vehicle OFF, disconnect the X3 harness connector at the K9 Body Control Module, vehicle in Service Mode.
9. Test for less than 1 V between the S82 Windshield Wiper/Washer Switch signal circuit terminal 3 and ground.
 - **If 1 V or greater**

Repair the short to voltage on the circuit.
 - **If less than 1 V**
10. Test or replace the S82 Windshield Wiper/Washer Switch.

Windshield Wiper Motor Malfunction

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the M75 Windshield Wiper Motor. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
 - **If 10 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
3. Vehicle in Service Mode.

4. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is OK and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Vehicle OFF, remove the test lamp.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, M75 Windshield Wiper Motor
 - **If the test lamp illuminates**
5. Connect a test lamp between the control circuit terminal 3 and ground.
6. Verify the test lamp turns ON and OFF when turning the high speed wipers ON and OFF.
 - **If the test lamp is always OFF**
 1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
7. Remove the test lamp.
8. Test for 8 - 9 V between the serial data circuit terminal 4 and ground.
 - **If less than 8 V**
 1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the serial data circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the serial data circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω , replace the K9 Body Control Module.
 - **If greater than 9 V**
1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the serial data circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V or greater, replace the K9 Body Control Module.
 - **If 8 - 9 V**
9. Test or replace the M75 Windshield Wiper Motor.

Component Testing

Windshield Wiper/Washer Switch

1. Vehicle OFF, disconnect the harness connector at the S82 Windshield Wiper/Washer Switch.
2. Test for infinite resistance between the signal terminal 1 and the low reference terminal 2 with the high speed switch in the open position.
 - **If less than infinite resistance**

Replace the S82 Windshield Wiper/Washer Switch.

 - **If infinite resistance**
3. Test for less than 2 Ω between the signal circuit terminal 1 and the low reference circuit terminal 2 with the high speed switch in the closed position.
 - **If 2 Ω or greater**

Replace the S82 Windshield Wiper/Washer Switch.

 - **If less than 2 Ω**
4. Test for infinite resistance between the signal terminal 3 and the low reference terminal 2 with the low speed switch in the open position.
 - **If less than infinite resistance**

Replace the S82 Windshield Wiper/Washer Switch.

 - **If infinite resistance**
5. Verify the resistance readings are within the specified range listed below between the signal circuit terminal 3 and the low reference circuit terminal 1 by pushing the switch in the listed positions below.
 - Delay 1 : 3.75-3.85k Ω
 - Delay 2 : 2.75-2.85k Ω
 - Delay 3 : 1.95-2.05k Ω
 - Delay 4 : 1.25-1.35k Ω
 - Delay 5 : 765-775 Ω
 - **If not within the specified range**

Replace the S82 Windshield Wiper/Washer Switch.

- **If within the specified range**

6. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

LOW WASHER FLUID INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	2	1	-	-
Ground	-	1	-	-
1. Low washer fluid message always displayed 2. Low washer fluid message never displayed				

Circuit/System Description

The check washer fluid message is controlled by the instrument cluster using signal from the Windshield Washer Fluid level Sensor. The washer fluid level signal circuit is supplied voltage through a resistor then monitored within the instrument cluster. The Windshield Washer Fluid level Sensor is normally open so the instrument cluster detects voltage on the Windshield Washer Fluid level Sensor signal circuit whenever the washer fluid level sensor is low. When the washer fluid reaches the point where the driver should be informed that the washer fluid is low, the washer fluid level sensor closes. When the washer fluid level sensor is closed the washer fluid level signal circuit voltage is pulled low, and the instrument cluster displays the Adding Washer Fluid message on the driver information center. In order to prevent the Adding Washer Fluid message from being displayed while sloshing is occurring in the washer fluid container, the instrument cluster is programmed with a 1 min delay before changing states of the check washer fluid message during an ignition cycle.

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Washer Fluid Level Switch parameter changes between ON and OFF, when filling and emptying the windshield water bottle.
 - **If the parameter does not change**

Refer to Circuit/System Testing.
 - **If the parameter changes**
3. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B118B Windshield Washer Fluid Level Switch. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
 - **If 10 Ω or greater**
 1. Ignition OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
3. Ignition ON.
4. Verify the scan tool Washer Fluid Level Switch parameter is Off
 - **If not Off**
 1. Ignition OFF, disconnect the harness connector at the P16 Instrument Cluster.

2. Test for infinite resistance between the signal circuit terminal 1 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the P16 Instrument Cluster.

• **If Off**

5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the ground circuit terminal 2.

6. Verify the scan tool Washer Fluid Level Switch parameter is On.

• **If not On**

1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the P16 Instrument Cluster, ignition ON.

2. Test for less than 1 V between the signal circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V

3. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the P16 Instrument Cluster.

• **If On**

7. Test or replace the B118B Windshield Washer Fluid Level Switch.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Windshield Washer Switch parameter changes between Active and Inactive when

pressing the windshield washer switch.

- **If the parameter does not change**

Refer to Circuit/System Testing - Windshield Wiper/Washer Switch Malfunction.

- **If the parameter changes**

3. Verify the G24 Windshield Washer Pump activates and deactivates when commanding the Windshield Washer Relay Active and Inactive with a scan tool.

- **If the G24 Windshield Washer Pump does not activate or does not deactivate**

Refer to Circuit/System Testing - Windshield Washer Pump Malfunction

- **If the G24 Windshield Washer Pump activates and deactivates**

4. All OK.

Circuit/System Testing

Windshield Wiper/Washer Switch Malfunction

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S82 Windshield Wiper/Washer Switch. It may take up to 11 min for all vehicle systems to power down.

2. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.

- **If 10 Ω or greater**

1. Vehicle OFF.

2. Test for less than 2 Ω in the low reference circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K9 Body Control Module.

- **If less than 10 Ω**

3. Vehicle in Service Mode.

4. Verify the scan tool Windshield Washer Switch parameter is Inactive.

- **If not Inactive**

1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module.

2. Test for infinite resistance between the signal circuit terminal 5 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the K9 Body Control Module.

- **If Inactive**

5. Install a 3 A fused jumper wire between the signal circuit terminal 5 and the low reference circuit terminal 2.

6. Verify the scan tool Windshield Washer Switch parameter is Active.

- **If not Active**

1. Vehicle OFF, remove the jumper wire, disconnect the harness connector at the K9 Body Control Module, vehicle in Service Mode.

2. Test for less than 1 V between the signal circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
- **If Active**

7. Test or replace the S82 Windshield Wiper/Washer Switch.

Windshield Washer Pump Malfunction

1. Vehicle OFF, and all vehicle systems OFF. Disconnect the harness connector at the G24 Windshield Washer Pump. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
 - **If 10 Ω or greater**
 1. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
3. Connect a test lamp between the control circuit terminal 1 and the ground circuit terminal 2, vehicle in Service Mode.
4. Verify the test lamp turn ON and OFF when commanding the Windshield Washer Relay Active and Inactive with a scan tool.
 - **If the test lamp turns ON and OFF**

Test or replace the G24 Windshield Washer Pump.
 - **If the test lamp does not turn ON and OFF**
5. Vehicle OFF, connect the harness connector at the G24 Windshield Washer Pump. Disconnect the X1 harness connector at the X50A Fuse Block - Underhood. It may take up to 2 min for all vehicle systems to power down.
6. Test for less than 10 Ω between the ground circuit terminal 48 and ground.
 - **If 10 Ω or greater**
 1. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
7. Vehicle in Service Mode.
8. Verify the G24 Windshield Washer Pump is not activated.
 - **If the G24 Windshield Washer Pump is activated**
 1. Vehicle OFF, disconnect the harness connector at the G24 Windshield Washer Pump, vehicle in Service Mode.
 2. Test for less than 1 V between the control circuit terminal 1 and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the G24 Windshield Washer Pump.
 - **If the G24 Windshield Washer Pump is not activated**
9. Connect a 20 A fused jumper wire between the control circuit terminal 14 and B+.
 10. Verify the G24 Windshield Washer Pump activates.
 - **If the G24 Windshield Washer Pump does not activate**
 1. Vehicle OFF, remove the jumper wire, disconnect the harness connector at the G24 Windshield Washer Pump.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than Infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the G24 Windshield Washer Pump.
 - **If the G24 Windshield Washer Pump activates**
 11. Vehicle OFF, connect the X1 harness connector at the X50A Fuse Block - Underhood. Disconnect the X4 harness connector at the K9 Body Control Module, vehicle in Service Mode.
 12. Verify the G24 Windshield Washer Pump is not activated.
 - **If the G24 Windshield Washer Pump is activated**
 1. Vehicle OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood, vehicle in Service Mode.
 2. Test for less than 1 V between the K9 Body Control Module control circuit terminal 14 X4 and ground, vehicle in Service Mode.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the X50A Fuse Block - Underhood.
 - **If the G24 Windshield Washer Pump is not activated**
 13. Connect a 10 A fused jumper wire between the control circuit terminal 14 and B+.
 14. Verify the G24 Windshield Washer Pump activates.
 - **If the G24 Windshield Washer Pump does not activate**
 1. Vehicle OFF, remove the jumper wire, disconnect the X2 harness connector at the X50A Fuse Block - Underhood.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If less than infinite resistance
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , test or replace the X50A Fuse Block - Underhood.
 - **If the G24 Windshield Washer Pump activates**
 15. Replace the K9 Body Control Module.

Component Testing

Windshield Wiper/Washer Switch

1. Vehicle OFF, disconnect the harness connector at the S82 Windshield Wiper/Washer Switch.
2. Test for infinite resistance between the signal terminal 5 and the low reference terminal 2 with the switch in the open position.
 - **If less than infinite resistance**

Replace the S82 Windshield Wiper/Washer Switch.
 - **If infinite resistance**
3. Test for less than 2 Ω between the signal circuit terminal 5 and the low reference circuit terminal 2 with the switch in the closed position.
 - **If 2 Ω or greater**

Replace the S82 Windshield Wiper/Washer Switch.
 - **If less than 2 Ω**
4. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Windshield Washer Pump Replacement**
- **Windshield Wiper and Washer Switch Replacement**
- **Fuse Block Replacement**
- **Control Module References** for body control module replacement, programming and setup.

WIPER BLADE ELEMENT CHECK

Fig. 2: Wiper Blade Element Check

Courtesy of GENERAL MOTORS COMPANY

1. Remove the wiper blade from the wiper arm. Refer to [Windshield Wiper Blade Replacement](#).
2. Look down the entire length of the blade element.
3. The rubber part of the element (2) that contacts the window must be on the center line of the blade plus or minus 15 degrees (1).
4. Replace the blade element (2) if the element exceeds 15 degrees from the centerline of the blade, or if the element is cracked or torn. Refer to [Windshield Wiper Blade Replacement](#)
5. Install the wiper blade onto the windshield wiper arm.

REPAIR INSTRUCTIONS

WINDSHIELD WIPER AND WASHER SWITCH REPLACEMENT

Fig. 3: Windshield Wiper and Washer Switch
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures <u>Steering Column Lower Trim Cover Replacement</u> - Reposition the steering column upper trim cover as necessary.	
1	Windshield Wiper and Washer Switch Procedure - Disconnect the electrical connector. - Release the retaining tabs and remove the windshield wiper and washer switch from the turn signal switch bracket.

WINDSHIELD WASHER NOZZLE HOSE REPLACEMENT

Fig. 4: Windshield Washer Nozzle Hose
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed. The High Voltage Disabling procedure includes the following steps: • Identify how to disable high voltage. • Identify how to test for the

	presence of high voltage. - Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed. Before working on any high voltage system, be sure to wear the following Personal Protection Equipment: - Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors. - Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors. - Visually and functionally inspect the gloves before use. - Wear the Insulation gloves with leather

Callout	Component Name
	protectors at all times when working with the high voltage battery assembly, whether the system is energized or not. Failure to follow the procedures may result in serious injury or death. Preliminary Procedures 1. <u>Front Wheelhouse Liner Replacement (Left Side)</u> <u>Front Wheelhouse Liner Replacement (Right Side)</u> 2. Drain the windshield washer solvent into a suitable clean container. 3. Remove Windshield Washer Nozzle Hose@Windshield Washer Solvent Container <u>Windshield Washer Solvent Container Replacement</u> 4. <u>Hood Insulator Replacement</u>
1	Windshield Washer Nozzle Hose Procedure 1. Remove the three washer nozzle hose retainers from the front wheelhouse panel inner front brace. 2. Remove the washer nozzle hose retainer from the hood hinge. 3. Remove the two washer nozzle hose retainers from the hood inner panel. 4. Remove the washer nozzle hose from both windshield washer nozzles. 5. Carefully remove the washer nozzle hose from the engine compartment.

WINDSHIELD WASHER NOZZLE REPLACEMENT

Fig. 5: Windshield Washer Nozzle
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Open the hood. 2. <u>Hood Insulator Replacement</u> 3. Disconnect the windshield washer pump hose.	
1	Windshield Washer Nozzle Procedure Depress the windshield washer nozzle tabs and push the nozzle upward and outward from the hood.

WINDSHIELD WASHER SOLVENT CONTAINER FILLER TUBE REPLACEMENT

Fig. 6: Windshield Washer Solvent Container Filler Tube

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Open the hood.	
1	Windshield Washer Solvent Container Filler Tube Procedure Pull upward on the filler tube in order to disconnect the filler tube from the windshield washer solvent container grommet.

WINDSHIELD WASHER SOLVENT CONTAINER GROMMET REPLACEMENT

Fig. 7: Windshield Washer Solvent Container Grommet

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
<u>Windshield Washer Solvent Container Filler Tube Replacement</u>	
1	Windshield Washer Solvent Container Grommet Procedure 1. Carefully squeeze the grommet while using a flat-bladed tool to pry upward under the edge of the grommet. 2. When installing a new grommet, use full strength windshield washer fluid as a lubricant on the grommet. 3. Place the grommet to the windshield washer solvent container. 4. Use the palm of the hand to seat the grommet into the windshield washer solvent container.

WINDSHIELD WASHER SOLVENT CONTAINER REPLACEMENT

Fig. 8: Windshield Washer Solvent Container
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Windshield Washer Solvent Container Filler Tube Replacement 2. Headlamp Replacement - Disconnect the electrical connectors.	
1	Windshield Washer Solvent Container Nut (Qty: 3) CAUTION: Refer to Fastener Caution . Tighten 9 N.m (80 lb in)
2	Windshield Washer Pump Hose Procedure Disconnect the windshield washer pump hose.
3	Windshield Washer Solvent Container Procedure

Callout	Component Name
	1. Remove the windshield washer solvent container from the vehicle. 2. Drain the windshield washer solvent into a suitable clean container. 3. Transfer components as necessary. 4. Fill the washer container with clean washer solvent once the installation has been completed.

WINDSHIELD WASHER PUMP REPLACEMENT

Fig. 9: Windshield Washer Pump
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. <u>Front Bumper Fascia Removal and Installation</u> 2. Place a clean suitable drain pan under the windshield washer solvent container to contain any lost windshield washer solvent.	
1	Windshield Washer Pump Procedure 1. Disconnect the electrical connector. 2. Disconnect the windshield washer pump hose.

Callout	Component Name
	3. Using two flat-bladed tools underneath the washer pump grommet, turn the flat-blades in opposite directions to disengage the washer pump from the washer pump grommet. 4. Remove the washer pump grommet and discard.

WINDSHIELD WASHER PUMP GROMMET REPLACEMENT

Callout	Component Name
WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage	

Callout	Component Name
	component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed. The High Voltage Disabling procedure includes the following steps: • Identify how to disable high voltage. • Identify how to test for the presence of high voltage. • Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed. Before working on any high voltage system, be sure to wear the following Personal Protection Equipment: • Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.

Callout	Component Name
• Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors. • Visually and functionally inspect the gloves before use. • Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not. Failure to follow the procedures may result in serious injury or death. Preliminary Procedures 1. <u>Windshield Wiper Arm Replacement</u> 2. <u>Air Inlet Grille Panel Extension Replacement</u> 3. <u>Hood Rear Weatherstrip Replacement</u>	
1	Air Inlet Grille Panel Retainer (Qty: 8) Procedure Use a flat bladed plastic tool to remove the push-in retainers.

Callout	Component Name
2	Air Inlet Grille Panel Procedure Lift the grille panel forward and upward to clear the pivot shafts from the vehicle.

AIR INLET GRILLE PANEL EXTENSION REPLACEMENT

Fig. 13: Air Inlet Grille Panel Extension
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Air Inlet Grille Panel Extension Procedure Disengage the retainers while working from the front to rear then pull the extension forward to remove.

WINDSHIELD WIPER ARM REPLACEMENT

Fig. 14: Windshield Wiper Arm

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Open the hood.	
1	Windshield Wiper Arm Finish Cap Procedure Using a flat balded tool, remove the cap from the wiper arm.
2	Windshield Wiper Arm Nut CAUTION: Refer to Fastener Caution . Tighten 30 N.m (22 lb ft)
3	Windshield Wiper Arm CAUTION: To avoid breakage of the windshield,

Callout	Component Name
	protect the surrounding area of the part which you are removing or installing. Procedure 1. Use the J 39822 Wiper Arm Puller to remove the wiper arm from the wiper motor pivot shaft. 2. Clean the pivot shaft splines with a soft wire brush. 3. Grasp the rear of the wiper arm, place the arm over the pivot shaft. 4. Align the tip of the wiper blade to the small transparent circle in the lower center windshield blackout area. 5. Install the windshield wiper arm nut. 6. Cycle the wiper arm with a spray of windshield washer solvent, PARK the wiper arms and re-check the alignment of the wiper blade tip to the windshield transparent circle. Special Tools J 39822 Wiper Arm Puller

WINDSHIELD WIPER BLADE REPLACEMENT

Fig. 15: Windshield Wiper Blade
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Windshield Wiper Blade Procedure 1. Lift the windshield wiper arm from the windshield. 2. Depress the small square tab on the topside of the wiper arm. 3. Rotate the blade downward and slide the wiper blade from the wiper arm.

WINDSHIELD WIPER SYSTEM MODULE REPLACEMENT

Fig. 16: Windshield Wiper System Module

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed. The High Voltage Disabling procedure includes the following steps: • Identify how to disable high voltage. • Identify how to	

Callout	Component Name
	test for the presence of high voltage. - Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed. Before working on any high voltage system, be sure to wear the following Personal Protection Equipment: - Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors. - Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors. - Visually and functionally inspect the gloves before use. - Wear the Insulation gloves with

Callout	Component Name
	leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not. Failure to follow the procedures may result in serious injury or death. CAUTION: To avoid breakage of the windshield, protect the surrounding area of the part which you are removing or installing. Preliminary Procedures 1. Open the hood. 2. <u>Front Suspension Strut Housing Brace Replacement</u>
1	Windshield Wiper System Module Bolt (Qty: 3) CAUTION: Refer to <u>Fastener Caution</u> .

Callout	Component Name
	Tighten 9 N.m (80 lb in)
2	Windshield Wiper System Module Procedure 1. Slide a 3 foot piece of 5/16 inch rubber hose, cut along its length, along the edge of the windshield to prevent any accidental damage. Remove the hose before reinstalling components. 2. Lift the front edge of the assembly and pull slightly forward in order to disengage the center support from the backside of the plenum. 3. Disconnect the electrical connector. 4. Remove the system module from the plenum. NOTE: • The lower part of the windshield is not supported by the body structure. It cannot support a technician's weight when leaning on the lower edge of the windshield while performing repairs. The glass also may crack if the exposed edge of the windshield is hit with any tool. • The windshield wiper transmission and motor are a one

Callout	Component Name
	piece module assembly and replaced together.

WINDSHIELD MULTIFUNCTION SENSOR MOUNT BRACKET COVER REPLACEMENT

Fig. 17: Windshield Multifunction Sensor Mount Bracket Cover

WINDSHIELD GLASS CLEANING

Exterior

Clean the windshield with windshield cleaner, GM P/N 19287404 (18 oz.) or 19259280 (6 oz.) (Canadian P/N 88865156) or equivalent. The cleaner should not harm the paint finish or scratch the glass. The glass is clean when the water no longer beads, but sheets across the entire glass surface.

Interior

The interior glass should be cleaned with plain water only applied with a clean terry cloth towel. Water only eliminates any film or haze on the window and helps prevent fogging.

WIPER BLADE ELEMENT CLEANING

Lift each blade assembly off of the windshield and clean the element with a cloth saturated with full strength washer solvent. Hold the blade in one hand and wipe the element with the saturated cloth until the black residue disappears. Then rinse the blade assembly elements with clean drinkable water.

WIPER CHATTER REPAIR

Some vehicles may exhibit a condition where the windshield wipers chatter and/or wipe unevenly. Several items may contribute to this condition. To completely repair this condition, ALL of the items listed should be inspected and corrected as necessary.

1. Inspect the wiper blade element set. Refer to [Wiper Blade Element Check](#)
2. Clean the wiper blade elements. Refer to [Wiper Blade Element Cleaning](#)
3. Clean the windshield. Refer to [Windshield Glass Cleaning](#)

DESCRIPTION AND OPERATION

WIPER/WASHER SYSTEM DESCRIPTION AND OPERATION

Wiper/Washer System Components

The wiper/washer system consists of the following electrical components:

- Windshield Washer Pump Relay
- Windshield Washer Pump
- Windshield Wiper Motor
- Windshield Wiper/Washer Switch
- Underhood Fuse Block (Contains Windshield Washer Pump PCB Relay)
- Body Control Module (BCM)

Windshield Wiper System

The body control module (BCM) controls the wiper motor based on an input from the wiper switch, and when wiper operation is requested, the BCM will send serial data messages to the windshield wiper motor module. The front wiper system consists of a driver's side and passenger's side wiper arm which are connected by a mechanical linkage driven by the windshield wiper motor module. The windshield wiper motor module contains the necessary electronics, motor, and position sensors to execute front wiper commands from the BCM. The windshield wiper motor module clears the front windshield by controlling the up and down wiper arm movement by the use of a reversing motor and an internal position sensor. The sensor keeps track of the gear wheel position and when the windshield wiper motor module determines that the wiper arms are at a position to reverse direction, it reverses the motor supply voltage by use of its internal motor control circuitry. The BCM communicates with the windshield wiper motor module through serial data. The windshield wiper motor module provides system status and diagnostic information to the BCM for diagnostic reporting and operational purposes.

The BCM utilizes resistive multiplexing through the wiper switch to discern the requested action from the driver. The BCM will respond by commanding the specific wiper function to operate as follows:

1. Using intermittent wipes, the wipers pause briefly on the windshield. If the wiper level is moved to OFF or if additional wipes are not required, the wipers may move to the base of the windshield.
2. If the ignition is put in OFF while the wipers are on LO, HI, or INT, they will immediately stop.
3. If the ignition is put in OFF while the wipers are performing wipes due to windshield washing, the wipers continue to run until they reach the base of the windshield.
4. the wipe delay interval is a function of the INTERMITTENT Delay Interval Switch setting. When

enabled, the Intermittent with Speed feature affects each of the 5 normal Intermittent Delay Intervals as a function of vehicle Speed. The Delay Intervals shall be biased to a shorter delay period with faster vehicle speeds and to a longer delay period with a slower vehicle speed.

The windshield wiper system MIST operation is identical to LOW speed operation, except that the MIST switch is a press and release type switch. When the wiper switch is moved to the MIST position (1X) and released, low speed wiper motor operation is started and will continue until 1 cycle is complete. If the wiper switch is moved to the MIST position and held, the wiper motor will operate in the LOW speed mode until the switch is released.

To initiate high speed wiping operation, the BCM provides continuous high speed wiper operation through setting the serial data signal to high speed Wipe. When the wiper switch lever is moved to the high position (HI) and released, high speed wiper motor operation is started and high speed wiping operation is performed.

Fig. 19: Windshield Wiper System Diagram

Callout	Component Name
S82	S82 Windshield Wiper/Washer Switch
K9	K9 Body Control Module
M75	M75 Windshield Wiper Motor

Windshield Washer System

The windshield washer pump is controlled by the body control module (BCM) via a printed circuit board (PCB) relay. When the washer switch is depressed, the BCM's internally pulled high resistor is pulled low by the washer request circuit. The BCM then applies voltage through a control circuit to the PCB windshield washer

pump relay. With the relay energized, fused battery voltage is applied through the switch contacts of the relay and the control circuit to activate the windshield washer fluid pump.

GENERAL INFORMATION

Air/Wind Noise - Volt

DIAGNOSTIC INFORMATION AND PROCEDURES

AIR/WIND NOISE

Air / Wind Noise-Diagnosis and Tests

Tools

- Stethoscope
- Duct tape, foam, etc.

WARNING: Refer to [Assistant Driving Warning](#) .

Overview

To analyze a reported wind noise condition, use the following outline:

- Speak with the customer to obtain as much information as possible.
- Perform a static evaluation of the vehicle to identify potential areas of concern.
- Test drive the vehicle to determine the source of the noise.
- Select the appropriate solution.
- After repair, re-evaluate the vehicle to confirm the customer's complaint is resolved.

When test driving the vehicle, choose a regular route with smooth and straight roads. The area should have little traffic and little noise in order to minimize interference with the test. Drive the vehicle at the speed in which the noise was noticed, or until the noise is heard. Maintain safe and legal speeds.

You can diagnose the following types of wind noise:

- Wind whistle / wind leaks
- Wind rush

When moving at highway speeds, air pressure inside the vehicle becomes greater than the air pressure outside. When a leak occurs, the escaping air causes a hiss or a whistle. Wind whistle / wind leaks are repairable when properly root caused.

Wind rush occurs when air presses over the vehicle's body, and is related to the aerodynamics of the vehicle. Some wind rush is repairable as it relates to part fits and body panel fits. A thorough root cause analysis is required before concluding that the wind noise is not repairable.

Air / Wind Noise - Diagnostic Procedure

Use the following procedure in order to diagnose wind noise:

1. It is important to obtain as many details from the customer as possible in order to assure that you are

addressing the issue that the customer hears. Note the following details:

- The perceived location (B-pillar, mirror, roof, rear of vehicle, front of vehicle, high or low in vehicle)
- The location where the noise is loudest (specific location along the door header, front edge of sunroof, etc.)
- The volume of the noise (very loud, can only hear when radio is off and no ambient noises)
- The ambient conditions (temperature, windy, direction of wind, quiet)
- The road surface (rough, smooth, smooth concrete, ribbed concrete, asphalt)
- The vehicle speed (city, highway, all speeds)
- The interior fan speed (off, low, high, floor mode, defrost, etc.)
- The position of the windows (closed, partially open, full open, which windows are open-front and/or rear, driver and/or passenger)
- The position of the sunroof (closed, partially open, full open)
- What the noise sounds like (whistle, hiss, swoosh, etc.)

2. Using the details learned from the customer, perform a visual inspection of the vehicle for possible causes of the wind noise.

- Misinstalled / torn weatherstrips (door glass seals, door to body seals, sunroof seals) - improper crimping, pins not fully engaged, seals not fully seated, seals pinched or deformed
- Poor Door fits (panels proud to each other, door headers protruding out, etc.)
- Poor Sunroof fits (sunroof proud to roof)
- Poor Windshield fits (windshield proud to roof, windshield lace/molding gaps/distortions, etc.)
- Roof Rack improperly installed (cross bar position fore-aft or backwards)
- Mirrors misinstalled (gapping of mirror patch, mirror skull cap gaps, mirror gasket pinched, seals pinched, etc.)
- Poor Molding fits (windshield moldings, belt moldings, grilles, emblems)
- Any exterior aftermarket items installed (bug deflector, rain guards, etc.)
- Loose fasteners, broken weld joints, sealer and/or adhesive skips

3. Use the customer information to duplicate the driving conditions in order to duplicate the customer concern. Make sure you are working on the issue that the customer hears.

4. Tape off the area of concern on the outside of the vehicle to turn the noise off. Start with a large area of taping to identify the general area of the noise. Then progressively remove sections of the tape until the noise returns. This method can help pinpoint the source of the noise quickly.

5. If necessary, utilize some of the specific diagnostic procedures below (air pressure, bubble, etc.) to understand the leak path.

6. Based on a thorough understanding of the leak path from inside to outside, select the appropriate resolution (refit doors, reposition weatherstrips, reposition gaskets, replace seals, etc.).

7. After repair, test drive the vehicle to confirm the customer complaint is resolved.

TRACING POWDER OR CHALK TEST

Clean the weatherstrips and the contact surfaces with cleaning solvent.

1. Apply powder or chalk in an unbroken line to the contact surface of the weatherstrip surrounding the perimeter of the suspected areas.
2. Close the panel very lightly so as to not disturb the chalk or over-travel the door. Closing the panel completely presses the weatherstrip firmly against the mating surface.
3. Inspect the applied line on the weatherstrip. The applied line is marred where contact is good. A corresponding imprint is on the mating surfaces.
4. Gaps or irregularities in the powder or the chalk line on the mating surfaces indicate the areas with a poor seal.

AIR PRESSURE TEST

1. Close all the windows.
2. Turn the vehicles ventilation fan to the on position, with the selector on high speed and in the defrost mode (or panel mode with fresh air vent on - no recirc).
3. Unlock and close the doors.
4. Listen for escaping air along the door and the window seals with a stethoscope or a length of heater hose.
5. If unsuccessful in identifying the leak path, consider masking off the pressure relief valves (to increase cabin pressure) and perform the evaluation again.

SOAP SUDS OR BUBBLE TEST

1. Close all the windows.
2. Turn the vehicles ventilation fan to the on position, with the selector on high speed and in the defrost mode (or panel mode with fresh air vent on - no recirc).
3. Unlock and close the doors.
4. Apply the soap solution to the potential leak areas.
5. Look for bubbles revealing escaping air.
6. If unsuccessful in identifying the leak path, consider masking off the pressure relief valves (to increase cabin pressure) and perform the evaluation again.

REPAIR INSTRUCTIONS

EXTERIOR WINDNOISE

WARNING: Refer to [Assistant Driving Warning](#) .

Interior windnoise is not heard when the window is lowered. Interior windnoise is caused by the air leaving the inside of the vehicle through a seal or a seam.

1. Tape over the relief valves to cause added air pressure within the vehicle.
2. Test drive the vehicle and listen for windnoise or a whistle.
3. Pull the vehicle over and make the temporary repairs using masking tape. If you cannot determine the source of the windnoise, perform one or more of the following diagnostic tests:
 - [Air Pressure Test](#)
 - [Soap Suds or Bubble Test](#)

- Tracing Powder or Chalk Test

INTERIOR WINDNOISE

WARNING: Refer to Assistant Driving Warning .

Interior windnoise is not heard when the window is lowered. Interior windnoise is caused by the air leaving the inside of the vehicle through a seal or a seam.

1. Tape over the relief valves to cause added air pressure within the vehicle.
2. Test drive the vehicle and listen for windnoise or a whistle.
3. Pull the vehicle over and make the temporary repairs using masking tape. If you cannot determine the source of the windnoise, perform one or more of the following diagnostic tests:

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC P059F OR P151E: ACTIVE GRILLE AIR SHUTTER

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P059F

Active Grille Air Shutter 1 Performance

DTC P151E

Active Grille Air Shutter Actuator 1 Signal Message Counter Incorrect

Diagnostic Fault Information

Circuit	Short to	Open/High	Short to	Signal Performance
---------	----------	-----------	----------	--------------------

	Ground	Resistance	Voltage	
Ignition	P059F, P151E	P059F, P151E	-	-
Local Interconnect Network Serial Data Bus	U1510	U1510	U1510	U1510
Ground	-	P059F, P151E	-	-

Circuit/System Description

The active grille air shutter actuator closes louvers at the front bumper to enhance vehicle aerodynamics in driving situations where cooling and A/C loads are relatively low and high levels of front end airflow are not required. If high levels of airflow are required the active grille air shutter actuator opens the louvers. The Local Interconnect Network (LIN) Serial Data Bus signal from the engine control module, ignition and ground circuits enable the active grille air shutter actuator to operate. If the conditions for opening the louvers are reached the engine control module commands the active grille air shutter actuator to open the louvers.

Conditions for Running the DTC

- Ignition On/Vehicle in Service Mode.
- The battery voltage is greater than 10 V.
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

- The DTC P059F will be set during a key cycle when the commanded louver position can not be achieved after 5 attempts are made to move the louver. The DTC will be stored as current for this key cycle but the malfunction indicator lamp (MIL) will not be illuminated. The malfunction indicator lamp will illuminate in the second key cycle after a failed movement attempt is made in each of two back to back key cycles.
- The DTC P151E will set if there is a serial data communication failure.

Action Taken When the DTC Sets

DTC P059F and P151E are type B DTCs.

Conditions for Clearing the DTC

DTC P059F and P151E are type B DTCs.

3. Verify the active grille air shutter position parameter changes from 0% (fully closed) to 100% (fully open) when using the scan tool ECM Active Grille Air Shutter Position control function.
 - **If the louvers at the front bumper do not open and close**

Refer to Circuit/System Testing.
 - **If the louvers at the front bumper open and close**
4. Verify none of the following conditions are present:
 - Snow or ice packed in the front fascia which prevents the louvers from moving.
 - Debris or foreign objects which prevent the louvers from moving.
 - **If any of the conditions are present**

Clear any snow, ice or foreign objects from the front grille.
 - **If none of the conditions are present**
5. All OK

Circuit/System Testing

1. Ignition/Vehicle Off and all vehicle systems Off, disconnect the harness connector(s) at the active grille air shutter actuator(s). It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit and ground.
 - **If 10 Ω or greater**
 1. Ignition/Vehicle Off.
 2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 10 Ω**

3. Ignition On/Vehicle in Service Mode.

4. Verify a test lamp illuminates between the ignition circuit and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Ignition/Vehicle Off.

2. Test for less than 2 Ω in the ignition circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse. Refer to [Power Mode Mismatch](#).

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Ignition/Vehicle Off.

2. Test for infinite resistance between the ignition circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- **If the test lamp illuminates**

5. Ignition/Vehicle Off, disconnect the harness connector at the K20 Engine Control Module.

1. Test for infinite resistance between the LIN Serial Data Bus circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

2. Test for less than 2 Ω in the LIN Serial Data Bus circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω

3. Test for less than 1 V between the LIN Serial Data Bus circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V

6. Test or replace the M60A Active Grille Air Shutter 1 Motor Module.

7. Verify DTCs P059F, P151E or U1510 are not set while operating the vehicle under the conditions for setting the DTC.

- **If the DTC is set**

Replace the K20 Engine Control Module.

- **If the DTC is not set**

8. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

[Control Module References](#) for control module replacement, programming and setup.

SYMPTOMS - ACTIVE GRILLE AIR SHUTTER

NOTE: The following steps must be completed before using the symptom tables:

1. Perform the [Diagnostic System Check - Vehicle](#) before using the Symptom Tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to [Active Grille Air Shutter Description and Operation](#).

Visual/Physical Inspection

- Inspect for aftermarket devices which may affect the operation of the system. Refer to [Checking Aftermarket Accessories](#).
- Inspect the easily accessible or visible system components for obvious damage or conditions which may cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#).

Symptom List

[Active Grille Air Shutter 1 Malfunction](#)

ACTIVE GRILLE AIR SHUTTER 1 MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P059F

Active Grille Air Shutter 1 Performance

DTC P151E

Active Grille Air Shutter Actuator 1 Signal Message Counter Incorrect

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	P059F,	P059F, P151E	-	-

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
	P151E			
Local Interconnect Network Serial Data Bus	U1510	U1510	U1510	U1510
Ground	-	P059F, P151E	-	-

Circuit/System Description

The active grille air shutter actuator closes louvers at the front bumper to enhance vehicle aerodynamics in driving situations where cooling and A/C loads are relatively low and high levels of front end airflow are not required. If high levels of airflow are required the active grille air shutter actuator opens the louvers. The Local Interconnect Network (LIN) Serial Data Bus signal from the engine control module, ignition and ground circuits enable the active grille air shutter actuator to operate. If the conditions for opening the louvers are reached the engine control module commands the active grille air shutter actuator to open the louvers.

Conditions for Running the DTC

- Ignition On/Vehicle in Service Mode.
- The battery voltage is greater than 10 V.
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

- The DTC P059F will be set during a key cycle when the commanded louver position can not be achieved after 5 attempts are made to move the louver. The DTC will be stored as current for this key cycle but the malfunction indicator lamp (MIL) will not be illuminated. The malfunction indicator lamp will illuminate in the second key cycle after a failed movement attempt is made in each of two back to back key cycles.
- The DTC P151E will set if there is a serial data communication failure.

Action Taken When the DTC Sets

DTC P059F and P151E are type B DTCs.

Conditions for Clearing the DTC

DTC P059F and P151E are type B DTCs.

Circuit/System Verification

1. Ignition On/Vehicle in Service Mode.
2. Verify DTC U1510 is not set.
 - **If DTC U1510 is set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) for further diagnosis.
 - **If DTC U1510 is not set**
3. Verify the active grille air shutter position parameter changes from 0% (fully closed) to 100% (fully open) when using the scan tool ECM Active Grille Air Shutter Position control function.
 - **If the louvers at the front bumper do not open and close**

Refer to Circuit/System Testing.
 - **If the louvers at the front bumper open and close**
4. Verify none of the following conditions are present:
 - Snow or ice packed in the front fascia which prevents the louvers from moving.
 - Debris or foreign objects which prevent the louvers from moving.
 - **If any of the conditions are present**

Clear any snow, ice or foreign objects from the front grille.
 - **If none of the conditions are present**
5. All OK

Circuit/System Testing

1. Ignition/Vehicle Off and all vehicle systems Off, disconnect the harness connector(s) at the active grille air shutter actuator(s). It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit and ground.
 - **If 10 Ω or greater**
 1. Ignition/Vehicle Off.
 2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 10 Ω**

3. Ignition On/Vehicle in Service Mode.

4. Verify a test lamp illuminates between the ignition circuit and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Ignition/Vehicle Off.

2. Test for less than 2 Ω in the ignition circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse. Refer to [Power Mode Mismatch](#).

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Ignition/Vehicle Off.

2. Test for infinite resistance between the ignition circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- **If the test lamp illuminates**

5. Ignition/Vehicle Off, disconnect the harness connector at the K20 Engine Control Module.

1. Test for infinite resistance between the LIN Serial Data Bus circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

2. Test for less than 2 Ω in the LIN Serial Data Bus circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω

3. Test for less than 1 V between the LIN Serial Data Bus circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V

6. Test or replace the M60A Active Grille Air Shutter 1 Motor Module.

7. Verify DTCs P059F, P151E or U1510 are not set while operating the vehicle under the conditions for setting the DTC.

- **If the DTC is set**

Replace the K20 Engine Control Module.

- **If the DTC is not set**

8. All OK.

Callout	Component Name
Preliminary Procedure	
<u>Rear Bumper Fascia Removal and Installation</u>	
1	Rear Bumper Impact Bar Nut (Qty: 6) CAUTION: Refer to <u>Fastener</u> <u>Caution</u> . Tighten 58 N.m (43 lb ft)
2	Rear Bumper Impact Bar Procedure Transfer components as necessary.

DESCRIPTION AND OPERATION

ACTIVE GRILLE AIR SHUTTER DESCRIPTION AND OPERATION

The active grille air shutter system closes shutters in the front grille to enhance vehicle aerodynamics in driving situations where cooling and A/C loads are relatively low and high levels of front end airflow are not required.

If high levels of airflow are required the active grille air shutter system will open one or both shutters. The control signal from the engine control module, ignition and ground circuits enable the active grille air shutter actuators to operate. If the conditions for opening the shutters are reached the engine control module commands the active grille air shutter actuators to open one or both shutters.

The dual active grille air shutter system consists of two aero shutter mechanisms located in the front grille for controlling the amount of air flowing through the grille. It includes three wires; ground, power and a Local Interconnect Network (LIN) Bus serial data circuit from the engine control module to the shutter actuator. The engine control module determines shutter state based on various vehicle conditions such as vehicle speed, coolant temperature, fan state, refrigerant system pressure, A/C compressor state and ambient temperature. The engine control module has the ability to command each shutter individually to the open or closed positions through communications on the LIN Bus.

The actuators are powered by an ignition circuit that is active when the key is in the RUN position. The vehicle may have to be driven for up to 13 minutes at speeds greater than 41 km/h (25 mph) before a shutter begins to move. If low ambient temperature is detected, the shutters will remain in the closed position.

SPECIFICATIONS

DIMENSIONS - BODY

Point-to-point measurements are for reference only. All measurements are given in millimeters. Use these measurements for diagnosing and estimating. Point-to-point measurements are duplicated with tram bar pointers set at equal lengths. All die marks, holes, slots, and fasteners are measured to the center. All dimensions are symmetrical unless otherwise specified.

REPAIR INSTRUCTIONS

FRONT END UPPER TIE BAR REPLACEMENT

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

Removal Procedure

WARNING: Refer to [Approved Equipment for Collision Repair Warning](#) .

WARNING: Refer to [Collision Sectioning Warning](#) .

WARNING: Refer to [Glass and Sheet Metal Handling Warning](#) .

CAUTION: Refer to [Collision Repair Anchoring Caution](#) .

1. Disable the SIR system. [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. [High Voltage System Inspection](#) .
3. Remove all related panels and components.
4. Visually inspect the vehicle for additional damage to the vehicle structure. Repair as much of the damage to the vehicle structure as possible, prior to replacing any damaged parts.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. [Anti-Corrosion Treatment and Repair](#) .

Fig. 10: Front End Upper Tie Bar

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage or cut attaching panels and reinforcements. Structure Identification.

NOTE: Record the number and location of the original welds for installation of the service assembly.

6. Remove all factory welds from front end tie bar (1).

Fig. 11: Front End Upper Tie Bar

Courtesy of GENERAL MOTORS COMPANY

7. Remove the damaged front end upper tie bar (1) from vehicle (2).

NOTE: If impact resistant adhesive is present remove and replace as necessary.

8. Remove the impact resistant adhesive from the repair area, as necessary. [Metal Panel Bonding](#).

Installation Procedure

NOTE: Squeeze Type Resistance Spot Welds equivalent to the factory spot welds are recommended. If access to use Squeeze Type Resistance Spot Welds is not possible, MIG/MAG plug welds may be used, to replace those specific welds.

1. Prepare all mating surfaces for welding as necessary.

Fig. 12: Front End Upper Tie Bar

Courtesy of GENERAL MOTORS COMPANY

2. Position the front end upper tie bar (1) on the vehicle (2) using 3-dimensional measuring equipment.
3. Verify the fit of the front end upper tie bar (1).
4. Apply the impact resistant adhesive to the repair area, as necessary. [**Metal Panel Bonding.**](#)

Fig. 13: Front End Upper Tie Bar

Courtesy of GENERAL MOTORS COMPANY

5. Clamp the front end upper tie bar (1) into position.
6. Weld the front end upper tie bar (1) accordingly.
7. Apply the sealers and anti-corrosion materials to the repair area, as necessary. [Anti-Corrosion Treatment and Repair](#) .
8. Install the body side outer panel as necessary.
9. Paint the repaired area. [Basecoat/Clearcoat Paint Systems](#) .
10. Install all related panels and components.
11. If disabled, enable the high voltage system. [High Voltage Enabling](#) .
12. Enable the SIR System. [SIR Disabling and Enabling](#) .

FRONT END LOWER TIE BAR REPLACEMENT

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

10. Install all related panels and components.
11. If disabled, enable the high voltage system. Refer to [High Voltage Enabling](#).
12. Enable the SIR system. Refer to [SIR Disabling and Enabling](#).

FRONT WHEELHOUSE PANEL REPLACEMENT

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any

High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
 - **Visually and functionally inspect the gloves before use.**
 - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

Removal Procedure

WARNING: Refer to [Approved Equipment for Collision Repair Warning](#) .

WARNING: Refer to [Collision Sectioning Warning](#) .

WARNING: Refer to [Glass and Sheet Metal Handling Warning](#) .

CAUTION: Refer to [Collision Repair Anchoring Caution](#) .

NOTE: Left shown, right similar.

1. Disable the SIR system. [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. [High Voltage System Inspection](#) .
3. Remove all related panels and components.
4. Visually inspect the vehicle for additional damage to the vehicle structure. Repair as much of the damage to the vehicle structure as possible, prior to replacing any damaged parts.
5. Remove the sealers and anti-corrosion materials from the repair area as necessary. [Anti-Corrosion Treatment and Repair](#) .

7. Replace factory brazing welds with MIG brazing welds (1) on front compartment upper side rail accordingly.
8. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .
9. Install the body side outer panel as necessary.
10. Paint the repaired area. Refer to [Basecoat/Clearcoat Paint Systems](#) .
11. Install all related panels and components.
12. If disabled, enable the high voltage system. Refer to [High Voltage Enabling](#) .
13. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

WINDSHIELD INNER UPPER FRAME REINFORCEMENT REPLACEMENT

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

Removal Procedure

WARNING: Refer to [Approved Equipment for Collision Repair Warning](#) .

WARNING: Refer to [Collision Sectioning Warning](#) .

WARNING: Refer to [Glass and Sheet Metal Handling Warning](#) .

CAUTION: Refer to [Collision Repair Anchoring Caution](#) .

NOTE: The windshield inner upper frame reinforcement is an ultra-high strength dual phase steel and cannot be sectioned or repaired. [Ultra High Strength Steel](#).

NOTE: There are sectioning procedures available for various locations of the body side outer panel. The sectioning procedure and location should be chosen based on the extent of damage to the vehicle and any additional inner reinforcements that need to be replaced. Refer to the body side outer panel sectioning procedures for the specific location where sectioning is required.

NOTE: Left shown right similar.

1. Disable the SIR system. [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. [High Voltage System Inspection](#) .
3. Remove all related panels and components.

4. Visually inspect the vehicle for additional damage to the vehicle structure. Repair as much of the damage to the vehicle structure as possible, prior to replacing any damaged parts.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. [Anti-Corrosion Treatment and Repair](#) .
6. Section the body side outer panel as required for access to replace the windshield inner upper frame reinforcement.

Fig. 36: Windshield Inner Upper Frame Reinforcement

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage or cut attaching panels and reinforcements. Refer to [Structure Identification](#).

NOTE: Record the number and location of the original welds for installation of the service assembly.

7. Remove all factory welds from the windshield inner upper frame reinforcement (1).

Fig. 37: Windshield Inner Upper Frame Reinforcement
Courtesy of GENERAL MOTORS COMPANY

8. Remove the damaged windshield inner upper frame reinforcement (1) from vehicle (2).

NOTE: If impact resistant adhesive is present remove and replace as necessary.

9. Remove the impact resistant adhesive from the repair area, as necessary. [Metal Panel Bonding](#).

Installation Procedure

NOTE: Squeeze Type Resistance Spot Welds equivalent to the factory spot welds are recommended. If access to use Squeeze Type Resistance Spot Welds is not possible, MIG/MAG plug welds may be used, to replace those specific welds.

1. Prepare all mating surfaces for welding as necessary.

6. Clamp the windshield inner upper frame reinforcement (1) into position.
7. Weld the windshield inner upper frame reinforcement (1) accordingly.
8. Apply the sealers and anti-corrosion materials to the repair area as necessary. [Anti-Corrosion Treatment and Repair](#) .

NOTE: Before refinishing, refer to [Adhesive Installation of Windshields](#) , and [Adhesive Installation of Liftgate Windows](#) .

9. Install the body side outer panel as necessary
10. Paint the repaired area. [Basecoat/Clearcoat Paint Systems](#) .
11. Install all related panels and components.
12. If disabled, enable the high voltage system. [High Voltage Enabling](#) .
13. Enable the SIR System. [SIR Disabling and Enabling](#) .

FRONT HINGE PILLAR BODY REPLACEMENT

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

Removal Procedure

WARNING: Refer to [Approved Equipment for Collision Repair Warning](#) .

WARNING: Refer to [Collision Sectioning Warning](#) .

WARNING: Refer to [Glass and Sheet Metal Handling Warning](#) .

CAUTION: Refer to [Collision Repair Anchoring Caution](#) .

NOTE: The front hinge pillar is an ultra-high strength steel and cannot be sectioned or repaired. Refer to [Ultra High Strength Steel](#).

NOTE: There are sectioning procedures available for various locations of the body side outer panel. The sectioning procedure and location should be chosen based on the extent of damage to the vehicle and any additional inner reinforcements that need to be replaced. Refer to the body side outer panel sectioning procedures for the specific location where sectioning is required.

NOTE: Left shown right similar.

1. Disable the SIR System. Refer to [SIR Disabling and Enabling](#) .

2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .
3. Remove all related panels and components.
4. Visually inspect the vehicle for additional damage to the vehicle structure. Repair as much of the damage to the vehicle structure as possible, prior to replacing any damaged parts.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .
6. Section the body side outer panel as required for access to replace the front hinge pillar.

Fig. 40: Front Hinge Pillar Body

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage or cut attaching panels and reinforcements. Refer to [Structure Identification](#).

NOTE: Record the number and location of the original welds for installation of the service assembly.

7. Remove all factory welds from front hinge pillar body (1).

Fig. 41: Front Hinge Pillar Body

Courtesy of GENERAL MOTORS COMPANY

8. Remove the damaged front hinge pillar body (1) from vehicle (2).

NOTE: If impact resistant adhesive is present remove and replace as necessary.

9. Remove the impact resistant adhesive from the repair area, as necessary. Refer to [Metal Panel Bonding](#).

Installation Procedure

NOTE: Squeeze Type Resistance Spot Welds equivalent to the factory spot welds are recommended. If access to use Squeeze Type Resistance Spot Welds is not possible, MIG/MAG plug welds may be used, to replace those specific welds.

1. Prepare all mating surfaces for welding as necessary.

Fig. 42: Front Hinge Pillar Body

Courtesy of GENERAL MOTORS COMPANY

2. Position the front hinge pillar body (1) on the vehicle (2) using 3-dimensional measuring equipment.
3. Verify the fit of the front hinge pillar body (1).

Fig. 43: Front Hinge Pillar Body

Courtesy of GENERAL MOTORS COMPANY

4. Apply the impact resistant adhesive to the repair area, as necessary. Refer to [Metal Panel Bonding](#).
5. Clamp the front hinge pillar body (1) into position.
6. Weld the front hinge pillar body (1) accordingly.
7. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#).
8. Install the body side outer panel as necessary.
9. Paint the repaired area. Refer to [Basecoat/Clearcoat Paint Systems](#).
10. Install all related panels and components.
11. If disabled, enable the high voltage system. Refer to [High Voltage Enabling](#).
12. Enable the SIR system. Refer to [SIR Disabling and Enabling](#).

ROOF OUTER PANEL REPLACEMENT

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any

High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
 - **Visually and functionally inspect the gloves before use.**
 - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

Removal Procedure

WARNING: Refer to [Approved Equipment for Collision Repair Warning](#) .

WARNING: Refer to [Collision Sectioning Warning](#) .

WARNING: Refer to [Glass and Sheet Metal Handling Warning](#) .

CAUTION: Refer to [Collision Repair Anchoring Caution](#) .

1. Disable the SIR system. [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. [High Voltage System Inspection](#) .
3. Remove all related panels and components.
4. Visually inspect the vehicle for additional damage to the vehicle structure. Repair as much of the damage to the vehicle structure as possible, prior to replacing any damaged parts.
5. Remove the sealers and anti-corrosion materials from the repair area as necessary. [Anti-Corrosion Treatment and Repair](#) .

Fig. 44: Roof Outer Panel

8. Remove the damaged roof panel (1) from vehicle (2).

Installation Procedure

Fig. 46: Roof Outer Panel

Courtesy of GENERAL MOTORS COMPANY

NOTE: Squeeze Type Resistance Spot Welds equivalent to the factory spot welds are recommended. If access to use Squeeze Type Resistance Spot Welds is not possible, MIG/MAG plug welds may be used, to replace those specific welds.

1. Dry fit the roof panel (1) to the vehicle (2).
2. Remove roof panel (1) from vehicle (2) and prepare all mating surfaces for welding as necessary.

Fig. 47: Apply Anti-Flutter Foam To Roof Bows

Courtesy of GENERAL MOTORS COMPANY

3. Apply anti-flutter foam-slow set 40 - 50 minute working time, or equivalent, to roof bows (1) as noted from original roof bows.

Fig. 48: Roof Outer Panel

Courtesy of GENERAL MOTORS COMPANY

4. Position the roof outer panel (1) on the vehicle (2) using 3-dimensional measuring equipment.
5. Verify the fit of the roof outer panel (1).
6. Apply the impact resistant adhesive to the repair area, as necessary. **Metal Panel Bonding**
7. Clamp the roof outer panel (1) to the vehicle (2).

Fig. 49: Roof Outer Panel

Courtesy of GENERAL MOTORS COMPANY

8. Weld the front and rear roof outer panel (1) accordingly to the vehicle (2).
9. Weld both sides of the roof outer panel to the vehicle (2). To create a solid weld with minimum heat distortion, make 25 mm (1 in) stitch welds along the seam with 25 mm (1 in) gaps between them. Then go back and complete the stitch weld.
10. Apply the sealers and anti-corrosion materials to the repair area as necessary. [Anti-Corrosion Treatment and Repair](#) .

NOTE: Before refinishing, refer to [Adhesive Installation of Windshields](#) , and [Adhesive Installation of Liftgate Windows](#) .

11. Paint the repaired area. [Basecoat/Clearcoat Paint Systems](#)
12. Install all related panels and components.
13. If disabled, enable the high voltage system. [High Voltage Enabling](#) .
14. Enable the SIR System. [SIR Disabling and Enabling](#) .

ROOF INNER SIDE RAIL REPLACEMENT

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

Removal Procedure

WARNING: Refer to [Approved Equipment for Collision Repair Warning](#) .

WARNING: Refer to [Collision Sectioning Warning](#) .

WARNING: Refer to [Glass and Sheet Metal Handling Warning](#) .

CAUTION: Refer to [Collision Repair Anchoring Caution](#) .

NOTE: The roof inner side rail is an ultra-high strength dual phase steel and cannot be sectioned or repaired. [Ultra High Strength Steel](#).

NOTE: There are sectioning procedures available for various locations of the body side outer panel. The sectioning procedure and location should be chosen based on the extent of damage to the vehicle and any additional inner reinforcements that need to be replaced. Refer to the body side outer panel sectioning procedures for the specific location where sectioning is required.

NOTE: Left shown right similar.

1. Disable the SIR system. [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .
3. Remove all related panels and components.
4. Visually inspect the vehicle for additional damage to the vehicle structure. Repair as much of the damage to the vehicle structure as possible, prior to replacing any damaged parts.
5. Remove the sealers and anti-corrosion materials from the repair area as necessary. [Anti-Corrosion Treatment and Repair](#) .
6. Section the body side outer panel as required for access to replace the roof inner side rail.

Fig. 50: Roof Inner Side Rail

7. Weld the roof inner side rail (1) accordingly.
8. Apply the sealers and anti-corrosion materials to the repair area as necessary. [Anti-Corrosion Treatment and Repair](#) .
9. Install the body side outer panel as necessary.

NOTE: Before refinishing, refer to [Adhesive Installation of Windshields](#) , and [Adhesive Installation of Liftgate Windows](#)

10. Paint the repaired area. [Basecoat/Clearcoat Paint Systems](#) .
11. Install all related panels and components.
12. If disabled, enable the high voltage system. [High Voltage Enabling](#) .
13. Enable the SIR System. [SIR Disabling and Enabling](#) .

ROCKER INNER PANEL REPLACEMENT

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

Removal Procedure

WARNING: Refer to [Approved Equipment for Collision Repair Warning](#) .

WARNING: Refer to [Collision Sectioning Warning](#) .

WARNING: Refer to [Glass and Sheet Metal Handling Warning](#) .

CAUTION: Refer to [Collision Repair Anchoring Caution](#) .

NOTE: The rocker outer panel reinforcement is an ultra-high strength dual phase steel and cannot be sectioned or repaired. [Ultra High Strength Steel](#)

NOTE: There are sectioning procedures available for various locations of the body side outer panel. The sectioning procedure and location should be chosen based on the extent of damage to the vehicle and any additional inner reinforcements that need to be replaced. Refer to the body side outer panel sectioning procedures for the specific location where sectioning is required.

NOTE: Left shown right similar

1. Disable the SIR system. [SIR Disabling and Enabling](#) .

2. Inspect the high voltage system. [High Voltage System Inspection](#) .
3. Remove all related panels and components.
4. Visually inspect the vehicle for additional damage to the vehicle structure. Repair as much of the damage to the vehicle structure as possible, prior to replacing any damaged parts.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. [Anti-Corrosion Treatment and Repair](#) .
6. Section the body side outer panel as required for access to replace the rocker inner panel.

6. Section the body side outer panel within the recommended areas (1).

Fig. 71: Center Pillar Of Body Side Outer Panel Sectioning Area
Courtesy of GENERAL MOTORS COMPANY

7. Section the center pillar of the body side outer panel within the recommended area (1).

NOTE: The following steps are to be used for both the body side outer and the center pillar sections.

8. Locate and remove all factory welds. Note the number and location of welds for installation of the body side outer section.

NOTE: Do not damage any other panel or reinforcements when cutting at the marked locations.

9. Cut the body side outer panel at the recommended areas (1).

10. Remove the body side outer section.

NOTE: If impact resistant adhesive is present remove and replace as necessary.

11. Remove the impact resistant adhesive from the repair area, as necessary. [Metal Panel Bonding](#).

Installation Procedure

Fig. 72: Body Side Outer Panel Sectioning Areas

Courtesy of GENERAL MOTORS COMPANY

NOTE: Squeeze Type Resistance Spot Welds equivalent to the factory spot welds are recommended. If access to use Squeeze Type Resistance Spot Welds is not possible, MIG/MAG plug welds may be used, to replace those specific welds.

NOTE: If MIG/MAG is going to be used drill 8 mm (5/16 in) plug weld holes as necessary in locations noted from the original body side outer panel (1).

1. From the service part, cut the body side outer panel in corresponding locations (1) to overlap the remaining original panel by 25 mm (1 in) at each joint locations.

Fig. 73: Center Pillar Of Body Side Outer Panel Sectioning Area
Courtesy of GENERAL MOTORS COMPANY

2. From the service part, cut the body side outer panel for the center pillar section in corresponding locations (1) to overlap the remaining original panel by 25 mm (1 in) at each joint locations.

NOTE: **The following steps are to be used for both the body side outer and the center pillar sections.**

3. Prepare all mating surfaces for welding, as necessary.
4. Apply GM - approved Weld-Thru coating or equivalent to all mating surfaces. [Anti-Corrosion Treatment and Repair](#) .
5. Apply the impact resistant adhesive to the repair area, as necessary. [Metal Panel Bonding](#).
6. Position the new service panel and clamp in place.
7. Weld accordingly.
8. Clean and prepare all welded surfaces.
9. Apply the sealers and anti-corrosion materials to the repair area as necessary. [Anti-Corrosion Treatment and Repair](#) .

NOTE: Before refinishing, refer to [Adhesive Installation of Windshields](#) , and [Adhesive Installation of Liftgate Windows](#) .

10. Paint the repaired area. [Basecoat/Clearcoat Paint Systems](#) .
11. Install all related panels and components.
12. Enable the SIR System. [SIR Disabling and Enabling](#) .
13. Connect the battery negative cable. [Battery Negative Cable Disconnection and Connection](#) .

REAR FLOOR PANEL SECTIONING

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

Removal Procedure

WARNING: Refer to [Approved Equipment for Collision Repair Warning](#) .

WARNING: Refer to [Collision Sectioning Warning](#) .

WARNING: Refer to [Glass and Sheet Metal Handling Warning](#) .

CAUTION: Refer to [Collision Repair Anchoring Caution](#) .

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .

3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#).

Fig. 74: Marking Cut Location Rearward From No. 5 Bar
Courtesy of GENERAL MOTORS COMPANY

6. Measure 40 mm rearward from the rear edge of the #5 bar (1). Mark the cut location (2).

Fig. 75: Marked Cut Location

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage or cut attaching panels and reinforcements. Refer to **Structure Identification**.

7. Cut the floor at the marked location (1).

Fig. 76: Rear Floor Panel Section

Courtesy of GENERAL MOTORS COMPANY

8. Remove all factory welds (1).
9. Remove floor section (2) from vehicle.

NOTE: If impact resistant adhesive is present remove and replace as necessary.

10. Remove the impact resistant adhesive from the repair area, as necessary. Refer to [Metal Panel Bonding](#).

Fig. 77: Cutting Service Part In Corresponding Location

Courtesy of GENERAL MOTORS COMPANY

NOTE: The service part is supplied as a complete floor and will need to be cut at the proper location for sectioning. The service part will overlap the original floor panel by approximately 40 mm at the cut location.

11. Locate rear edge of the #5 bar location (1). Mark the cut location.
12. Cut the service part at the marked location (1).

Installation Procedure

Fig. 78: Marking Service Part For Plug Welding Locations

Courtesy of GENERAL MOTORS COMPANY

NOTE: Squeeze Type Resistance Spot Welds equivalent to the factory spot welds are recommended. If access to use Squeeze Type Resistance Spot Welds is not possible, MIG/MAG plug welds may be used, to replace those specific welds.

1. Create 1 row of plug welds in the service part as follows. Measure 20 mm from the front edge of the service part (1). Mark a straight line across the width of the service part (2).

Fig. 79: Drilling Plug Weld Holes

Courtesy of GENERAL MOTORS COMPANY

2. Drill 8 mm (5/16 in) plug weld holes, every 40 mm along the marked row.
3. Prepare all mating surfaces for welding, as necessary.
4. Apply GM-approved Weld-Thru Coating or equivalent to all mating surfaces. Refer to [Anti-Corrosion Treatment and Repair](#) .
5. Apply the impact resistant adhesive to the repair area, as necessary. Refer to [Metal Panel Bonding](#).

Fig. 80: Rear Floor Panel Section

Courtesy of GENERAL MOTORS COMPANY

6. Position the rear floor section (2) to the vehicle using 3-dimensional measuring equipment. Clamp the part in place.
7. Weld accordingly (1).
8. Clean and prepare all welded surfaces for painting.
9. Paint the repaired area. Refer to [Basecoat/Clearcoat Paint Systems](#) .
10. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .
11. Paint the repaired area. Refer to [Basecoat/Clearcoat Paint Systems](#) .
12. Install all related panels and components.
13. If disabled, enable the high voltage system. Refer to [High Voltage Enabling](#) .
14. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

REAR WHEELHOUSE INNER PANEL REPLACEMENT

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

Removal Procedure

WARNING: Refer to [Approved Equipment for Collision Repair Warning](#) .

WARNING: Refer to [Collision Sectioning Warning](#) .

WARNING: Refer to [Glass and Sheet Metal Handling Warning](#) .

CAUTION: Refer to [Collision Repair Anchoring Caution](#) .

NOTE: Left shown right similar.

1. Disable the SIR System. Refer to [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .
3. Remove all related panels and components.
4. Visually inspect the vehicle for additional damage to the vehicle structure. Repair as much of the damage to the vehicle structure as possible, prior to replacing any damaged parts.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .

Fig. 81: Rear Wheelhouse Inner Panel

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage or cut attaching panels and reinforcements. Refer to **Structure Identification**.

NOTE: Record the number and location of the original welds for installation of the service assembly.

6. Remove all factory welds from the rear wheelhouse inner panel (1).

Fig. 82: Rear Wheelhouse Inner Panel

Courtesy of GENERAL MOTORS COMPANY

7. Remove the damaged rear wheelhouse inner panel (2) from vehicle (1).

NOTE: If impact resistant adhesive is present remove and replace as necessary.

8. Remove the impact resistant adhesive from the repair area, as necessary. Refer to [Metal Panel Bonding](#).

Installation Procedure

NOTE: Squeeze Type Resistance Spot Welds equivalent to the factory spot welds are recommended. If access to use Squeeze Type Resistance Spot Welds is not possible, MIG/MAG plug welds may be used, to replace those specific welds.

1. Prepare all mating surfaces for welding as necessary.

Fig. 83: Rear Wheelhouse Inner Panel

Courtesy of GENERAL MOTORS COMPANY

2. Position the rear wheelhouse inner panel (2) on the vehicle (1) using 3-dimensional measuring equipment.
3. Verify the fit of the rear wheelhouse inner panel (2).

Fig. 84: Rear Wheelhouse Inner Panel

Courtesy of GENERAL MOTORS COMPANY

4. Apply the impact resistant adhesive to the repair area, as necessary. Refer to [Metal Panel Bonding](#).
5. Clamp the rear wheelhouse inner panel (1) into position.
6. Weld the rear wheelhouse inner panel (1) accordingly.
7. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#).
8. Install the body side outer panel as necessary.
9. Paint the repaired area. Refer to [Basecoat/Clearcoat Paint Systems](#).
10. Install all related panels and components.
11. If disabled, enable the high voltage system. Refer to [High Voltage Enabling](#).
12. Enable the SIR system. Refer to [SIR Disabling and Enabling](#).

REAR WHEELHOUSE OUTER PANEL REPLACEMENT

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any

High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

Removal Procedure

WARNING: Refer to [Approved Equipment for Collision Repair Warning](#) .

WARNING: Refer to [Collision Sectioning Warning](#) .

WARNING: Refer to [Glass and Sheet Metal Handling Warning](#) .

CAUTION: Refer to [Collision Repair Anchoring Caution](#) .

NOTE: There are sectioning procedures available for various locations of the body side outer panel. The sectioning procedure and location should be chosen based on the extent of damage to the vehicle and any additional inner reinforcements that need to be replaced. Refer to the body side outer panel sectioning procedures for the specific location where sectioning is required.

NOTE: Left shown right similar.

1. Disable the SIR System. Refer to [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .
3. Remove all related panels and components.
4. Visually inspect the vehicle for additional damage to the vehicle structure. Repair as much of the damage to the vehicle structure as possible, prior to replacing any damaged parts.

5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .
6. Section the body side outer panel as required for access to replace the rear wheelhouse outer panel.

Fig. 85: Rear Wheelhouse Outer Panel

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage or cut attaching panels and reinforcements. Refer to [Structure Identification](#).

NOTE: Record the number and location of the original welds for installation of the service assembly.

7. Remove all factory welds from rear wheelhouse outer panel (1).

Fig. 86: Rear Wheelhouse Outer Panel

8. Remove the damaged rear wheelhouse outer panel (2) from vehicle (1).

NOTE: If impact resistant adhesive is present remove and replace as necessary.

9. Remove the impact resistant adhesive from the repair area, as necessary. Refer to [Metal Panel Bonding](#).

Installation Procedure

NOTE: Squeeze Type Resistance Spot Welds equivalent to the factory spot welds are recommended. If access to use Squeeze Type Resistance Spot Welds is not possible, MIG/MAG plug welds may be used, to replace those specific welds.

1. Prepare all mating surfaces for welding as necessary.

Fig. 87: Rear Wheelhouse Outer Panel

Courtesy of GENERAL MOTORS COMPANY

2. Position the rear wheelhouse outer panel (2) on the vehicle (1) using 3-dimensional measuring equipment.
3. Verify the fit of the rear wheelhouse outer panel (2).

Fig. 88: Rear Wheelhouse Outer Panel

Courtesy of GENERAL MOTORS COMPANY

4. Apply the impact resistant adhesive to the repair area, as necessary. Refer to [Metal Panel Bonding](#).
5. Clamp the rear wheelhouse outer panel (1) into position.
6. Weld the rear wheelhouse outer panel (1) accordingly.
7. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#).
8. Install the body side outer panel as necessary.
9. Paint the repaired area. Refer to [Basecoat/Clearcoat Paint Systems](#).
10. Install all related panels and components.
11. If disabled, enable the high voltage system. Refer to [High Voltage Enabling](#).
12. Enable the SIR system. Refer to [SIR Disabling and Enabling](#).

FLOOR PANEL NUMBER 5 CROSS BAR REPLACEMENT

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any

High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
 - **Visually and functionally inspect the gloves before use.**
 - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

Removal Procedure

WARNING: Refer to [Approved Equipment for Collision Repair Warning](#) .

WARNING: Refer to [Collision Sectioning Warning](#) .

WARNING: Refer to [Glass and Sheet Metal Handling Warning](#) .

CAUTION: Refer to [Collision Repair Anchoring Caution](#) .

1. Disable the SIR System. Refer to [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .
3. Remove all related panels and components.
4. Visually inspect the vehicle for additional damage to the vehicle structure. Repair as much of the damage to the vehicle structure as possible, prior to replacing any damaged parts
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .

Fig. 89: Floor Panel Number 5 Cross Bar

FRONT RAIL REPLACEMENT

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

Removal Procedure

WARNING: Refer to [Approved Equipment for Collision Repair Warning](#) .

CAUTION: Refer to [Collision Repair Anchoring Caution](#) .

NOTE: The front rail is an ultra-high strength steel and cannot be sectioned or repaired. [Ultra High Strength Steel](#)

NOTE: Left shown, right similar.

1. Disable the SIR system. [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. [High Voltage System Inspection](#) .
3. Remove all related panels and components.
4. Repair as much of the damage as possible to factory specifications. [Dimensions - Body](#).
5. Note the location and remove the sealers and anti-corrosion materials from the repair area. [Anti-Corrosion Treatment and Repair](#) .

Fig. 101: Front Rail

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage any inner panels or reinforcements.

6. Locate and remove out all factory welds. Note the number and location of the welds for installation of the front rail (1).

Fig. 102: Front Rail

Courtesy of GENERAL MOTORS COMPANY

7. Remove the damaged front rail (2) from the vehicle (1).

NOTE: If impact resistant adhesive is present remove and replace as necessary.

8. Remove the impact resistant adhesive from the repair area, as necessary. [Metal Panel Bonding](#).

Installation Procedure

NOTE: Squeeze Type Resistance Spot Welds equivalent to the factory spot welds are recommended. If access to use Squeeze Type Resistance Spot Welds is not possible, MIG/MAG plug welds may be used, to replace those specific welds.

Fig. 103: Service Part Front Rail

Courtesy of GENERAL MOTORS COMPANY

NOTE: If the location of the original plug weld holes cannot be determined, space the plug weld holes every 40 mm (1 1/2 in) apart.

1. Drill 8 mm (5/16 in) plug weld holes in the service part front rail (1) as necessary in the locations noted from the original panel.
2. Prepare all mating surfaces as necessary.
3. Apply GM-approved Weld-Thru Coating or equivalent to all mating surfaces. [Anti-Corrosion Treatment and Repair](#) .

Fig. 104: Front Rail

Courtesy of GENERAL MOTORS COMPANY

4. Apply the impact resistant adhesive to the repair area, as necessary. **Metal Panel Bonding.**
5. Position the front rail (1) to the vehicle (2) using 3-dimensional measuring equipment. Clamp the rail in place.

Fig. 105: Front Rail

Courtesy of GENERAL MOTORS COMPANY

6. Weld the front rail (1) accordingly.
7. Clean and prepare all welded surfaces.
8. Install all related panels and components.
9. Apply the sealers and anti-corrosion materials to the repair area as necessary. [Anti-Corrosion Treatment and Repair](#) .
10. Paint the repaired area. [Basecoat/Clearcoat Paint Systems](#) .
11. If disabled, enable the high voltage system. [High Voltage Enabling](#) .
12. Enable the SIR System. [SIR Disabling and Enabling](#) .

REAR RAIL END REPLACEMENT

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

Removal Procedure

4. Apply the impact resistant adhesive to the repair area, as necessary. [Metal Panel Bonding](#).
5. Clamp the rear rail end (1) into position.
6. Weld the rear rail end (1) accordingly.
7. Apply the sealers and anti-corrosion materials to the repair area as necessary. [Anti-Corrosion Treatment and Repair](#) .
8. Paint the repaired area. [Basecoat/Clearcoat Paint Systems](#)
9. Install all related panels and components.
10. If disabled, enable the high voltage system. [High Voltage Enabling](#)
11. Enable the SIR System. [SIR Disabling and Enabling](#) .

BODY HINGE PILLAR INNER PANEL REPLACEMENT

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

Removal Procedure

WARNING: Refer to [Approved Equipment for Collision Repair Warning](#) .

WARNING: Refer to [Collision Sectioning Warning](#) .

WARNING: Refer to [Glass and Sheet Metal Handling Warning](#) .

CAUTION: Refer to [Collision Repair Anchoring Caution](#) .

NOTE: There are sectioning procedures available for various locations of the body side outer panel. The sectioning procedure and location should be chosen based on the extent of damage to the vehicle and any additional inner reinforcements that need to be replaced. Refer to the body side outer panel sectioning procedures for the specific location where sectioning is required.

NOTE: The Roof side rail reinforcement is a High strength low alloy steel. [High Strength Low Alloy Steel](#).

NOTE: Left shown right similar.

1. Disable the SIR system. [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. [High Voltage System Inspection](#) .
3. Remove all related panels and components.
4. Visually inspect the vehicle for additional damage to the vehicle structure. Repair as much of the damage

to the vehicle structure as possible, prior to replacing any damaged parts.

5. Remove the sealers and anti-corrosion materials from the repair area as necessary. [Anti-Corrosion Treatment and Repair](#) .
6. Section the body side outer panel as required for access to replace the Front Hinge Pillar.

Fig. 110: Body Hinge Pillar Inner

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage or cut attaching panels and reinforcements. [Structure Identification](#).

NOTE: Record the number and location of the original welds for installation of the service assembly.

7. Remove all factory welds from body hinge pillar inner (1).

Fig. 111: Body Hinge Pillar Inner

Courtesy of GENERAL MOTORS COMPANY

8. Remove the damaged body hinge pillar inner (1) from vehicle (2).

NOTE: If impact resistant adhesive is present remove and replace as necessary.

9. Remove the impact resistant adhesive from the repair area, as necessary. [Metal Panel Bonding](#).

Installation Procedure

NOTE: Squeeze Type Resistance Spot Welds equivalent to the factory spot welds are recommended. If access to use Squeeze Type Resistance Spot Welds is not possible, MIG/MAG plug welds may be used, to replace those specific welds.

1. Prepare all mating surfaces for welding as necessary.

Fig. 112: Body Hinge Pillar Inner

4. Apply the impact resistant adhesive to the repair area, as necessary. [Metal Panel Bonding](#).
5. Clamp the body hinge pillar inner (1) into position.
6. Weld the body hinge pillar inner (1) accordingly.
7. Apply the sealers and anti-corrosion materials to the repair area as necessary. [Anti-Corrosion Treatment and Repair](#) .
8. Install the body side outer panel as necessary.

NOTE: Before refinishing, refer to [Adhesive Installation of Windshields](#) , or [Adhesive Installation of Liftgate Windows](#) .

9. Paint the repaired area. [Basecoat/Clearcoat Paint Systems](#) .
10. Install all related panels and components.
11. If disabled, enable the high voltage system. [High Voltage Enabling](#) .
12. Enable the SIR System. [SIR Disabling and Enabling](#) .

CENTER PILLAR INNER PANEL REPLACEMENT

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

Removal Procedure

WARNING: Refer to [Approved Equipment for Collision Repair Warning](#) .

WARNING: Refer to [Collision Sectioning Warning](#) .

WARNING: Refer to [Glass and Sheet Metal Handling Warning](#) .

CAUTION: Refer to [Collision Repair Anchoring Caution](#) .

NOTE: The center pillar inner panel is an ultra-high strength steel and cannot be sectioned or repaired. [Ultra High Strength Steel](#).

NOTE: There are sectioning procedures available for various locations of the body side outer panel. The sectioning procedure and location should be chosen based on the extent of damage to the vehicle and any additional inner reinforcements that need to be replaced. Refer to the body side outer panel sectioning procedures for the specific location where sectioning is required.

NOTE: Left shown right similar.

1. Disable the SIR system. [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. [High Voltage System Inspection](#) .
3. Remove all related panels and components.
4. Visually inspect the vehicle for additional damage to the vehicle structure. Repair as much of the damage to the vehicle structure as possible, prior to replacing any damaged parts.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. [Anti-Corrosion Treatment and Repair](#) .
6. Section the body side outer panel as required for access to replace the center inner panel.

Courtesy of GENERAL MOTORS COMPANY

4. Apply the impact resistant adhesive to the repair area, as necessary. Refer to [Metal Panel Bonding](#).
5. Clamp the center inner panel (1) into position.
6. Weld the center inner panel (1) accordingly.
7. Apply the sealers and anti-corrosion materials to the repair area as necessary. [Anti-Corrosion Treatment and Repair](#) .
8. Install the body side outer panel as necessary.
9. Paint the repaired area. [Basecoat/Clearcoat Paint Systems](#) .
10. Install all related panels and components.
11. If disabled, enable the high voltage system. Refer to [High Voltage Enabling](#) .
12. Enable the SIR System. [SIR Disabling and Enabling](#) .

CENTER PILLAR REPLACEMENT

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any

High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

Removal Procedure

WARNING: Refer to [Approved Equipment for Collision Repair Warning](#) .

WARNING: Refer to [Collision Sectioning Warning](#) .

WARNING: Refer to [Glass and Sheet Metal Handling Warning](#) .

CAUTION: Refer to [Collision Repair Anchoring Caution](#) .

NOTE: The front hinge pillar is an ultra-high strength steel and cannot be sectioned or repaired. Refer to [Ultra High Strength Steel](#).

NOTE: There are sectioning procedures available for various locations of the body side outer panel. The sectioning procedure and location should be chosen based on the extent of damage to the vehicle and any additional inner reinforcements that need to be replaced. Refer to the body side outer panel sectioning procedures for the specific location where sectioning is required.

NOTE: Left shown right similar.

1. Disable the SIR System. Refer to [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .

3. Remove all related panels and components.
4. Visually inspect the vehicle for additional damage to the vehicle structure. Repair as much of the damage to the vehicle structure as possible, prior to replacing any damaged parts.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .
6. Section the body side outer panel as required for access to replace the center pillar.

Fig. 118: Center Pillar

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage or cut attaching panels and reinforcements. Refer to [Structure Identification](#).

NOTE: Record the number and location of the original welds for installation of the service assembly.

7. Remove all factory welds from center pillar (1).

Fig. 119: Center Pillar

Courtesy of GENERAL MOTORS COMPANY

8. Remove the damaged center pillar (1) from vehicle (2).

NOTE: If impact resistant adhesive is present remove and replace as necessary.

9. Remove the impact resistant adhesive from the repair area, as necessary. Refer to [Metal Panel Bonding](#).

Installation Procedure

NOTE: Squeeze Type Resistance Spot Welds equivalent to the factory spot welds are recommended. If access to use Squeeze Type Resistance Spot Welds is not possible, MIG/MAG plug welds may be used, to replace those specific welds.

1. Prepare all mating surfaces for welding as necessary.

Fig. 120: Center Pillar

Courtesy of GENERAL MOTORS COMPANY

2. Position the center pillar (1) on the vehicle (2) using 3-dimensional measuring equipment.
3. Verify the fit of the center pillar.

Fig. 121: Center Pillar

Courtesy of GENERAL MOTORS COMPANY

4. Apply the impact resistant adhesive to the repair area, as necessary. Refer to [Metal Panel Bonding](#).
5. Clamp the center pillar (1) into position.
6. Weld the center pillar (1) accordingly.
7. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#).
8. Install the body side outer panel as necessary.
9. Paint the repaired area. Refer to [Basecoat/Clearcoat Paint Systems](#).
10. Install all related panels and components.
11. If disabled, enable the high voltage system. Refer to [High Voltage Enabling](#).
12. Enable the SIR system. Refer to [SIR Disabling and Enabling](#).

FRONT SIDE DOOR OUTER PANEL REPLACEMENT

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any

High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
 - **Visually and functionally inspect the gloves before use.**
 - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

Removal Procedure

WARNING: Refer to [Approved Equipment for Collision Repair Warning](#) .

NOTE: Before beginning the repair, refer to [Metal Panel Bonding](#) for proper adhesive applicator preparations and general information.

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .
3. Remove the door from the vehicle. Refer to [Front Side Door Replacement](#) .
4. Remove the outer door handle.
5. Remove the outside rearview mirror.

Fig. 122: Door Shell

Courtesy of GENERAL MOTORS COMPANY

6. Grind the edges of the door outer panel to separate the outer door panel from the door shell (1).

Fig. 123: Outer Door Panel And Door Shell

Courtesy of GENERAL MOTORS COMPANY

WARNING: Inspection of the door guard beam for damage must be performed before replacement of the door outer panel. If damage to the door guard beam is found the door must be replaced. Failure to do so may compromise the structural integrity of the vehicle and may cause personal injury if the vehicle is involved in a collision.

7. Remove the outer door panel (2) from the door shell (1).
8. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .

Fig. 124: Door Shell

Courtesy of GENERAL MOTORS COMPANY

9. Straighten the edges of the door shell (1).

Installation Procedure

Fig. 125: Door Shell

Courtesy of GENERAL MOTORS COMPANY

1. Using a grinding disk grind the surface of the door shell (1) mating flanges to bare steel.

Fig. 126: Door Outer Panel

Courtesy of GENERAL MOTORS COMPANY

2. Scuff the opposing mating surfaces of the door outer panel (1) to remove the gloss of the E-Coat.
3. Clean the mating surfaces.

Fig. 127: Apply Anti-Flutter Foam On Inner Safety Beam

Courtesy of GENERAL MOTORS COMPANY

4. Apply anti-flutter foam-slow set 40 - 50 minute working time, or equivalent, in 4 - 6 evenly spaced on the inner safety beam (1).

Fig. 128: Apply Bead Of Metal Panel Bonding Adhesive To Mating Surfaces
Courtesy of GENERAL MOTORS COMPANY

NOTE: The adhesive has a 40 - 50 minute working time. Do not allow the door to totally cure off the vehicle, as proper alignment of the door outer panel to the door shell will be difficult.

5. Apply a 3 - 6 mm (1/8 - 1/4 in) bead of metal panel bonding adhesive **Metal Panel Bonding**, to both of the mating surfaces.
6. Using a small acid brush, spread a coat of adhesive to cover all the bare metal surfaces to ensure corrosion protection.

Fig. 129: Outer Door Panel And Door Shell

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do NOT pull the panels apart after joined together. If necessary, slide the panels against each other to realign the panels.

7. Install the door outer panel (1) to the door shell (2).

Fig. 130: Door Shell

Courtesy of GENERAL MOTORS COMPANY

8. Clamp the door outer panel into position, as required.
9. Using a hammer, re-hem the hem flanges around the door shell (1). Continue to hammer in stages along the hem flanges.
10. Using lacquer thinner remove the excess adhesive from the door panel area.
11. Install the door to the vehicle. Inspect the door outer panel for proper alignment. Adjust the alignment, as required. Refer to [**Front Side Door Replacement**](#) .
12. Clean and prepare all welded surfaces.
13. Apply sealers and anti-corrosion materials to the repair area, as necessary. Refer to [**Anti-Corrosion Treatment and Repair**](#) .
14. Paint the repaired area. Refer to [**Basecoat/Clearcoat Paint Systems**](#) .
15. Install the outer door handle.
16. Install the outside rearview mirror.
17. Install the door to the vehicle. Refer to [**Front Side Door Replacement**](#) .
18. Enable the SIR system. Refer to [**SIR Disabling and Enabling**](#) .

19. If disabled, enable the high voltage system. Refer to [High Voltage Enabling](#) .

REAR SIDE DOOR OUTER PANEL REPLACEMENT

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

Removal Procedure

WARNING: Refer to [Approved Equipment for Collision Repair Warning](#) .

NOTE: Before beginning the repair, refer to [Metal Panel Bonding](#) for proper adhesive applicator preparations and general information.

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .
3. Remove the door from the vehicle. Refer to [Rear Side Door Replacement](#) .
4. Remove the outer door handle.

NOTE: Do NOT pull the panels apart after joined together. If necessary, slide the panels against each other to realign the panels.

7. Install the door outer panel (2) to the door shell (1).

Fig. 139: Door Shell

Courtesy of GENERAL MOTORS COMPANY

8. Clamp the door outer panel into position, as required.
9. Using a hammer, re-hem the hem flanges around the door shell (1). Continue to hammer in stages along the hem flanges.
10. Using lacquer thinner remove the excess adhesive from the door panel area.
11. Install the door to the vehicle. Inspect the door outer panel for proper alignment. Adjust the alignment, as required. Refer to [Rear Side Door Replacement](#) .
12. Clean and prepare all welded surfaces.
13. Apply sealers and anti-corrosion materials to the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .
14. Paint the repaired area. Refer to [Basecoat/Clearcoat Paint Systems](#) .
15. Install the outer door handle.
16. Install the door to the vehicle. Refer to [Front Side Door Replacement](#) .
17. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .
18. If disabled, enable the high voltage system. Refer to [High Voltage Enabling](#) .

ROOF SIDE RAIL REINFORCEMENT REPLACEMENT

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

Removal Procedure

WARNING: Refer to [Approved Equipment for Collision Repair Warning](#) .

WARNING: Refer to [Collision Sectioning Warning](#) .

WARNING: Refer to [Glass and Sheet Metal Handling Warning](#) .

CAUTION: Refer to [Collision Repair Anchoring Caution](#) .

NOTE: There are sectioning procedures available for various locations of the body side outer panel. The sectioning procedure and location should be chosen based on the extent of damage to the vehicle and any additional inner reinforcements that need to be replaced. Refer to the body side outer panel sectioning procedures for the specific location where sectioning is required.

NOTE: The roof side rail reinforcement is a High strength low alloy steel. [High Strength Low Alloy Steel](#).

NOTE: Left shown right similar.

1. Disable the SIR system. [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. [High Voltage System Inspection](#) .
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area as necessary. [Anti-Corrosion Treatment and Repair](#) .

Fig. 140: Roof Side Rail Reinforcement

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage or cut attaching panels and reinforcements. [Structure Identification](#).

NOTE: Record the number and location of the original welds for installation of the service assembly.

6. Remove all factory welds from the roof side rail reinforcement (1).

Fig. 141: Roof Side Rail Reinforcement

Courtesy of GENERAL MOTORS COMPANY

7. Remove the roof side rail reinforcement (1) from vehicle (2).

NOTE: If impact resistant adhesive is present remove and replace as necessary.

8. Remove the impact resistant adhesive from the repair area, as necessary. [Metal Panel Bonding](#).

Installation Procedure

NOTE: Squeeze Type Resistance Spot Welds equivalent to the factory spot welds are recommended. If access to use Squeeze Type Resistance Spot Welds is not possible, MIG/MAG plug welds may be used, to replace those specific welds.

1. Prepare all mating surfaces for welding as necessary.

Fig. 142: Roof Side Rail Reinforcement

Courtesy of GENERAL MOTORS COMPANY

2. Position the roof side rail reinforcement (1) on the vehicle (2) using 3-dimensional measuring equipment.
3. Verify the fit of the roof side rail reinforcement (1).
4. Apply the impact resistant adhesive to the repair area, as necessary. **Metal Panel Bonding**

Fig. 143: Roof Side Rail Reinforcement

Courtesy of GENERAL MOTORS COMPANY

5. Clamp the roof side rail reinforcement (1) into position.
6. Weld the roof side rail reinforcement (1) accordingly.
7. Apply the sealers and anti-corrosion materials to the repair area as necessary. [Anti-Corrosion Treatment and Repair](#) .

NOTE: Before refinishing, refer to [Adhesive Installation of Windshields](#) , and [Adhesive Installation of Liftgate Windows](#) .

8. Paint the repaired area. [Basecoat/Clearcoat Paint Systems](#) .
9. Install all related panels and components.
10. If disabled, enable the high voltage system. [High Voltage Enabling](#) .
11. Enable the SIR System. [SIR Disabling and Enabling](#) .

REAR RAIL REPLACEMENT

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

Removal Procedure

WARNING: Refer to [Approved Equipment for Collision Repair Warning](#) .

CAUTION: Refer to [Collision Repair Anchoring Caution](#) .

NOTE: Left shown, right similar.

1. Disable the SIR system. [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. [High Voltage System Inspection](#) .
3. Remove all related panels and components.
4. Repair as much of the damage as possible to factory specifications. [Dimensions - Body](#).
5. Note the location and remove the sealers and anti-corrosion materials from the repair area. [Anti-Corrosion Treatment and Repair](#) .

Fig. 144: Rear Rail

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage or cut attaching panels and reinforcements.

6. Locate and remove out all factory welds. Note the number and location of the welds for installation of the rear rail (1).

Fig. 145: Rear Rail

Courtesy of GENERAL MOTORS COMPANY

7. Remove the damaged rear rail (2) from the vehicle (1).

NOTE: If impact resistant adhesive is present remove and replace as necessary.

8. Remove the impact resistant adhesive from the repair area, as necessary. [Metal Panel Bonding](#).

Installation Procedure

NOTE: Squeeze Type Resistance Spot Welds equivalent to the factory spot welds are recommended. If access to use Squeeze Type Resistance Spot Welds is not possible, MIG/MAG plug welds may be used, to replace those specific welds.

NOTE: If the location of the original plug weld holes cannot be determined, space the plug weld holes every 40 mm (1 1/2 in) apart.

1. Drill 8 mm (5/16 in) plug weld holes in the service part front rail as necessary in the locations noted from

the original panel.

2. Prepare all mating surfaces as necessary.
3. Apply GM-approved Weld-Thru Coating or equivalent to all mating surfaces. [Anti-Corrosion Treatment and Repair](#) .

Fig. 146: Rear Rail

Courtesy of GENERAL MOTORS COMPANY

4. Position the rear rail (1) to the vehicle using 3-dimensional measuring equipment.
5. Apply the impact resistant adhesive to the repair area, as necessary. [Metal Panel Bonding](#)
6. Clamp the rail into position.

Fig. 147: Rear Rail

Courtesy of GENERAL MOTORS COMPANY

7. Weld the rear rail (1) accordingly.
8. Clean and prepare all welded surfaces.
9. Install all related panels and components.
10. Apply the sealers and anti-corrosion materials to the repair area as necessary. [Anti-Corrosion Treatment and Repair](#) .
11. Paint the repaired area. [Basecoat/Clearcoat Paint Systems](#) .
12. If disabled, enable the high voltage system. [High Voltage Enabling](#) .
13. Enable the SIR System. [SIR Disabling and Enabling](#) .

RAIL REPLACEMENT - REAR SECTION

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

Removal Procedure

Courtesy of GENERAL MOTORS COMPANY

4. Apply the impact resistant adhesive to the repair area, as necessary. Refer to [Metal Panel Bonding](#).
5. Clamp the rear floor panel filler (1) into position
6. Weld the rear floor panel filler (1) accordingly.
7. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#).
8. Paint the repaired area. Refer to [Basecoat/Clearcoat Paint Systems](#).
9. Install all related panels and components.
10. If disabled, enable the high voltage system. Refer to [High Voltage Enabling](#).
11. Enable the SIR system. Refer to [SIR Disabling and Enabling](#).

BATTERY TRAY REPLACEMENT

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

Removal Procedure

WARNING: Refer to [Approved Equipment for Collision Repair Warning](#) .

WARNING: Refer to [Collision Sectioning Warning](#) .

WARNING: Refer to [Glass and Sheet Metal Handling Warning](#) .

CAUTION: Refer to [Collision Repair Anchoring Caution](#) .

1. Disable the SIR system. [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. [High Voltage System Inspection](#) .
3. Remove all related panels and components.
4. Visually inspect the vehicle for additional damage to the vehicle structure. Repair as much of the damage to the vehicle structure as possible, prior to replacing any damaged parts.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. [Anti-Corrosion Treatment and Repair](#) .

Fig. 164: Battery Tray

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage or cut attaching panels and reinforcements. Structure Identification.

NOTE: Record the number and location of the original welds for installation of the service assembly.

6. Remove all factory welds from battery tray (1).

Fig. 165: Battery Tray

Courtesy of GENERAL MOTORS COMPANY

7. Remove the damaged battery tray (1) from vehicle (2).

NOTE: If impact resistant adhesive is present remove and replace as necessary.

8. Remove the impact resistant adhesive from the repair area, as necessary. [Metal Panel Bonding](#)

Installation Procedure

NOTE: Squeeze Type Resistance Spot Welds equivalent to the factory spot welds are recommended. If access to use Squeeze Type Resistance Spot Welds is not possible, MIG/MAG plug welds may be used, to replace those specific welds.

1. Prepare all mating surfaces as necessary.

Fig. 166: Battery Tray

Courtesy of GENERAL MOTORS COMPANY

2. Position the battery tray (1) on the vehicle (2) using 3-dimensional measuring equipment.
3. Verify the fit of the battery tray (1).
4. Apply the impact resistant adhesive to the repair area, as necessary. **Metal Panel Bonding**

Fig. 167: Battery Tray

Courtesy of GENERAL MOTORS COMPANY

5. Clamp the battery tray (1) into position.
6. Weld the battery tray (1) accordingly.
7. Apply the sealers and anti-corrosion materials to the repair area as necessary. [Anti-Corrosion Treatment and Repair](#) .
8. Paint the repaired area. [Basecoat/Clearcoat Paint Systems](#) .
9. Install all related panels and components.
10. If disabled, enable the high voltage system. [High Voltage Enabling](#) .
11. Enable the SIR System. [SIR Disabling and Enabling](#) .

RESISTANCE SPOT WELDED FULL PANEL REPLACEMENT

NOTE: Use this procedure for all panels that are replaced at the factory seams, unless a specific procedure exists in the Collision Repair section of this vehicle's service information.

Removal Procedure

WARNING: Refer to [Approved Equipment for Collision Repair Warning](#) .

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .
2. Disconnect the negative battery cable. Refer to [Battery Negative Cable Disconnection and Connection](#) .
3. Remove all related panels and components.
4. Repair as much of the damage as possible to factory specifications.

WARNING: Refer to [Foam Sound Deadeners Warning](#) .

5. Note the location and remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .

Fig. 168: Drilling Out Factory Welds (Full Panel)

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage any inner panels or reinforcements.

6. Locate and drill out all factory welds (1). Note the number and location of the welds for installation of the service part.

Fig. 169: Damaged Part (Full Panel)

Courtesy of GENERAL MOTORS COMPANY

7. Remove the damaged part (1).

Installation Procedure

NOTE: If the location of the original plug weld holes cannot be determined, space the plug weld holes every 40 mm (1 1/2 in) apart. Where structural adhesive was present, space the plug weld holes every 20 mm (3/4 in) apart.

1. Prepare all mating surfaces as necessary.
2. Apply GM-approved Weld-Thru Coating or equivalent to all mating surfaces. Refer to [Anti-Corrosion Treatment and Repair](#).
3. Position the service part. Clamp in place.

Fig. 170: Welding New Part (Full Panel)

Courtesy of GENERAL MOTORS COMPANY

4. Apply welds accordingly (1).
5. Clean and prepare all welded surfaces.
6. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .
7. Paint the repair area. Refer to [Basecoat/Clearcoat Paint Systems](#) .
8. Install all related panels and components.
9. Connect the negative battery cable. Refer to [Battery Negative Cable Disconnection and Connection](#) .
10. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

MIG WELDED FULL PANEL REPLACEMENT

Removal Procedure

WARNING: Refer to [Approved Equipment for Collision Repair Warning](#) .

NOTE: Use this procedure for all panels that are replaced at the factory seams, unless a specific procedure exists in the Collision Repair section of this vehicle's

service information.

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .
2. Disconnect the negative battery cable. Refer to [Battery Negative Cable Disconnection and Connection](#) .
3. Remove all related panels and components.
4. Repair as much of the damage as possible to factory specifications.

WARNING: Refer to [Foam Sound Deadeners Warning](#) .

5. Note the location and remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .

Fig. 171: Drilling Out Factory Welds (Full Panel)

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage any inner panels or reinforcements.

6. Locate and drill out all factory welds (1). Note the number and location of the welds for installation of the service part.

Fig. 172: Damaged Part (Full Panel)

Courtesy of GENERAL MOTORS COMPANY

7. Remove the damaged part (1).

Installation Procedure

Fig. 173: Drilling Plug Weld Holes (Full Panel)
Courtesy of GENERAL MOTORS COMPANY

NOTE: If the location of the original plug weld holes can not be determined, space the plug weld holes every 40 mm (1 1/2 in) apart. Where structural adhesive was present, space the plug weld holes every 20 mm (3/4 in) apart.

1. Drill 8 mm (5/16 in) plug weld holes in the service part as necessary in the locations noted from the original panel (1).
2. Prepare all attachment surfaces as necessary.
3. Prepare all mating surfaces as necessary.
4. Apply GM-approved Weld-Thru Coating or equivalent to all mating surfaces. Refer to [Anti-Corrosion Treatment and Repair](#) .
5. Position the service part. Clamp in place.

Fig. 174: Plug Welding Service Part (Full Panel)
Courtesy of GENERAL MOTORS COMPANY

6. Plug weld accordingly (1).
7. Clean and prepare all welded surfaces.
8. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .
9. Paint the repair area. Refer to [Basecoat/Clearcoat Paint Systems](#) .
10. Install all related panels and components.
11. Connect the negative battery cable. Refer to [Battery Negative Cable Disconnection and Connection](#) .
12. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

DESCRIPTION AND OPERATION

DUAL PHASE STEEL

This information provides repair recommendations and general guidelines for steel classified as Dual Phase Steel, also known as DP. This type of steel normally has a tensile strength below 780 MPa.

General Motors recommends the following when repairing or replacing this type of steel during collision repair.

NOTE: The use of heat to repair damage is not recommended for this classification of steel.

Recommended Repairs

- Cold repairs can be performed on this type of steel, unless the damage includes kinks. If the damage includes kinks, the part should be replaced.
- Sectioning or partial replacement of this type of steel is recommended only at approved locations, in a specific sectioning procedure.
- When recommended in a specific sectioning procedure, this type of steel can be used as a weld plate for reinforcing the sectioning location.
- Squeeze Resistance Spot Welding can be used to replace factory spot welds, where applicable.
- MIG plug welding and MIG stitch welding can be used on this type of steel.
- MIG Brazing can be used on this type of steel.

HIGH STRENGTH LOW ALLOY STEEL

This information provides repair recommendations and general guidelines for steel classified as High Strength Low Alloy Steel, also known as HSLA. This type of steel normally has a tensile strength range from 300 - 700 MPa.

General Motors recommends the following when repairing or replacing this type of steel during collision repair.

Recommended Repairs

- Cold repairs can be performed on this type of steel, unless the damage includes kinks. If the damage includes kinks, the part should be replaced.
- Controlled use of heat can be used to repair damage, if the heat does not exceed 650°C (1200°F). The heat should be applied a maximum of 2 times, for up to 90 seconds.
- Sectioning or partial replacement of this type of steel is recommended only at approved locations, in a specific sectioning procedure.
- When recommended in a specific sectioning procedure, this type of steel can be used as a weld plate for reinforcing the sectioning location.
- Squeeze Resistance Spot Welding can be used to replace factory spot welds, where applicable.
- MIG plug welding and MIG stitch welding can be used on this type of steel.
- MIG Brazing can be used on this type of steel.

METAL PANEL BONDING

This information is intended to provide general guidelines for adhesive bonding of steel panels. Panel bonding of steel is only recommended when the panel is originally bonded to the vehicle.

The adhesives listed in this document are known to meet the General Motors specifications and requirements for bonding of steel body panels.

Bonding procedures in general are applicable only at factory joints.

The use of adhesive to section steel panels is not recommended by General Motors.

Rivets, or other mechanical fasteners, may be used in combination with adhesive bonding of steel panels. The

specified rivets, or fasteners, should be used with adhesive, when replacing the original panel.

Two types of adhesives are listed here. Impact Resistant Adhesive is used in joints in frame rail assemblies and strut tower assemblies and other body structure joints that have critical strength requirements. The factory applied Impact Resistant Adhesive is purple in color when cured. The Impact Resistant adhesives available for servicing these joints are considerably stronger once cured than panel bonding adhesives. The other bonding adhesives are non-impact resistant, offer a lower strength rating and can be used in all other joints that are not originally made with Impact Resistant Adhesive.

NOTE: Always follow the adhesive manufacturer's instructions for application, handling, and curing for the specific product.

Adhesives currently meeting the performance requirements include the adhesive products listed below meet these guidelines:

Steel Panel Bonding Impact Resistant

MILD STEEL

This information provides repair recommendations and general guidelines for steel classified as Mild Steel. This type of steel normally has a tensile strength less than 270 MPa. This includes the common steel names of:

- Mild Steel
- Bake Hardenable Steel (BH)
- Solid Solution Strengthened Steel

General Motors recommends the following when repairing or replacing this type of steel during collision repair.

Recommended Repairs:

- Cold repairs can be performed on this type of steel, unless the damage includes kinks. If the damage includes kinks, the part should be replaced.
- Controlled use of heat can be used to repair damage, if the heat does not exceed 650°C (1200°F). The heat should be applied a maximum of 2 times, for up to 90 seconds.
- Sectioning or partial replacement of this type of steel is recommended only at approved locations, in a specific sectioning procedure.
- When recommended in a specific sectioning procedure, this type of steel can be used as a weld plate for reinforcing the sectioning location.
- Squeeze Resistance Spot Welding can be used to replace factory spot welds, where applicable
- MIG plug welding and MIG stitch welding can be used on this type of steel.
- MIG Brazing can be used on this type of steel.

ULTRA HIGH STRENGTH DUAL PHASE STEEL

This information provides repair recommendations and general guidelines for steel classified as Ultra High Strength Dual Phase Steel, also known as DPX. This type of steel normally has a tensile strength of 780 MPa, or greater.

General Motors recommends the following when repairing or replacing this type of steel during collision repair.

NOTE:

- **Repair of this type of steel is not recommended.**
- **This type of steel should be replaced at factory joints only. Sectioning or partial replacement is not recommended.**
- **The use of heat to repair damage is not recommended for this type of steel.**
- **Stitch Welding is not recommended for this type of steel (unless replacing a factory installed stitch weld).**
- **This type of steel should not be used as a weld plate for reinforcing the sectioning location.**

Recommended Repairs:

- Squeeze Resistance Spot Welding can be used to replace factory spot welds, where applicable.
- MIG plug welding can be used to replace factory spot welds.
- MIG Brazing can be used to replace factory spot welds.

ULTRA HIGH STRENGTH STEEL

This information provides repair recommendations and general guidelines for steel classified as Ultra High Strength Steel, also known as UHSS. This type of steel normally has a tensile strength of 780 MPa, or greater.

This includes the common steel names of

- Ultra High Strength Dual Phase Steel (DPX)

- Martensitic Steel (M)
- Boron/Press Hardened Steel (B)
- Multi-Phase Steel (MP)
- TRIP Steel (TR)

General Motors recommends the following when repairing or replacing this type of steel during collision repair.

NOTE:

- **Repair of this type of steel is not recommended.**
- **This type of steel should be replaced only, at factory joints. Sectioning or partial replacement is not recommended.**
- **The use of heat to repair damage is not recommended for this type of steel.**
- **Stitch Welding is not recommended for this type of steel (unless replacing a factory installed stitch weld).**
- **This type of steel should not be used as a weld plate for reinforcing the sectioning location.**

Recommended Repairs

- Squeeze Resistance Spot Welding can be used to replace factory spot welds, where applicable.
- MIG plug welding can be used to replace factory spot welds.
- MIG Brazing can be used to replace factory spot welds.

ACCESSORIES & EQUIPMENT

Frame and Underbody - Volt

SPECIFICATIONS

FASTENER SPECIFICATIONS

Single Use Threaded Fastener/Component Tightening Specifications

NOTE:

All fasteners/components listed in this table MUST BE DISCARDED and replaced with NEW after removal.

Application	Specification
	Metric (English)
Drivetrain and Front Suspension Cradle Bolt	
• First Pass:	70 N.m (52 lb ft)
• Final Pass:	45 - 60 Degrees
Drivetrain and Front Suspension Crossmember Extension Bolt	
• First Pass:	58 N.m (43 lb ft)
• Final Pass:	30 - 45 Degrees
Drivetrain and Front Suspension Crossmember Extension Nut	
• First Pass:	100 N.m (74 lb ft)
• Final Pass:	45 - 60 Degrees
Electric Belt Drive Rack and Pinion Steering Gear Bolt	
• First Pass:	55 N.m (41 lb ft)
• Final Pass:	150 - 165 Degrees
Front Lower Control Arm Front Bolt	
• First Pass:	100 N.m (74 lb ft)
• Final Pass:	45 - 60 Degrees

NOTE:

All fasteners/components listed in this table MUST BE DISCARDED and replaced with NEW after removal.

Application	Specification
	Metric (English)
Front Lower Control Arm Rear Bushing Nut	
• First Pass:	100 N.m (74 lb ft)
• Final Pass:	30 - 45 Degrees
Stabilizer Shaft Insulator Clamp Bolt	
• First Pass:	22 N.m (16 lb ft)
• Final Pass:	30 - 45 Degrees
Transmission Mount Strut Bolt - Drivetrain and Front Suspension Cradle Side	
• First Pass:	100 N.m (74 lb ft)
• Final Pass:	60 - 75 Degrees
Transmission Mount Strut Bolt - Transmission Side	
• First Pass:	100 N.m (74 lb ft)
• Final Pass:	60 - 75 Degrees

Reusable Threaded Fastener Tightening Specifications

NOTE:

All fasteners listed in this table can be reused after removal.

Application	Specification
	Metric (English)
Drivetrain and Front Suspension Brace Bolt	58 N.m (43 lb ft)
Front Compartment Splash Shield Bolt M4	2.5 N.m (22 lb in)
Front Compartment Splash Shield Bolt M6	7 N.m (62 lb in)
Front Compartment Splash Shield Plastic Nut	3 N.m (27 lb in)

NOTE:

All fasteners listed in this table can be reused after removal.

Application	Specification
	Metric (English)
Front Compartment Air Deflector Fastener M4	2.5 N.m (22 lb in)
Front Compartment Air Deflector Fastener M6	7 N.m (62 lb in)
Front Compartment Air Deflector Bolt	3 N.m (27 lb in)
Front Wheelhouse Liner Bolt	2.5 N.m (22 lb in)
Heater Water Bypass Valve Bracket Bolt	9 N.m (80 lb in)
Lower Ball Joint to Steering Knuckle Nut	
• First Pass:	35 N.m (26 lb ft)
• Final Pass:	30 - 45 Degrees
Radiator Air Side Baffle Bolt	9 N.m (80 lb in)
Rear Tire Front Air Deflector Fastener	2.5 N.m (22 lb in)
Rear Wheelhouse Liner Bolt	2.5 N.m (22 lb in)
Rear Wheelhouse Panel Liner Nut	2.5 N.m (22 lb in)
Stabilizer Shaft Link Nut	65 N.m (48 lb ft)
Underbody Front Air Deflector Nut	3 N.m (27 lb in)
Underbody Front Air Deflector Bolt	2.5 N.m (22 lb in)
Underbody Rear Air Deflector Nut	3 N.m (27 lb in)
Underbody Rear Air Deflector Screw	2.5 N.m (22 lb in)

REPAIR INSTRUCTIONS

FRONT COMPARTMENT SPLASH SHIELD REPLACEMENT

Fig. 1: Front Compartment Splash Shield

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
<u>Lifting and Jacking the Vehicle</u>	
1	Front Compartment Splash Shield Bolt (Qty: 8) CAUTION: <u>Fastener</u> <u>Caution</u> Tighten 2.5 N.m (22 lb in)
2	Front Compartment Splash Shield Retainer
3	Front Compartment Splash Shield Bolt (Qty: 3) Tighten 7 N.m (62 lb in)
4	Front Compartment Splash Shield Plastic Nut Tighten 3 N.m (27 lb in)
5	Front Compartment Splash Shield

FRONT COMPARTMENT AIR DEFLECTOR REPLACEMENT

Fig. 2: Front Compartment Air Deflector

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
<u>Lifting and Jacking the Vehicle</u>	
1	Front Compartment Air Deflector Fastener (Qty: 6) CAUTION: <u>Fastener</u> <u>Caution</u> Tighten 2.5 N.m (22 lb in)
2	Front Compartment Air Deflector Fastener (Qty: 2) Tighten 7 N.m (62 lb in)
3	Front Compartment Air Deflector Bolt Tighten 3 N.m (27 lb in)
4	Front Compartment Air Deflector Procedure Slide the front compartment air deflector from in between the front tire front air deflector and the wheelhouse liner.

FRONT UNDERBODY AIR DEFLECTOR REPLACEMENT

Fig. 3: Front Underbody Air Deflector
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures	
1. Front Compartment Splash Shield Replacement	
2. Front Compartment Air Deflector Replacement	
1	Front Wheelhouse Liner Bolt (Qty: 2) CAUTION: Fastener Caution Tighten 2.5 N.m (22 lb in)
2	Front Underbody Air Deflector Bolt (Qty: 10) Tighten 2.5 N.m (22 lb in)
3	Front Underbody Air Deflector Procedure Slightly bend the front wheelhouse liner on one side away to remove the front underbody air

Callout	Component Name
	deflector.

UNDERBODY FRONT AIR DEFLECTOR REPLACEMENT - LEFT SIDE

Fig. 4: Underbody Front Air Deflector - Left Side
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
<u>Front Compartment Splash Shield Replacement</u>	
1	Underbody Front Air Deflector Nut (Qty: 12) CAUTION: <u>Fastener</u> <u>Caution</u> Tighten 3 N.m (27 lb in)
2	Underbody Front Air Deflector Bolt (Qty: 4) Tighten 2.5 N.m (22 lb in)
3	Underbody Front Air Deflector

UNDERBODY FRONT AIR DEFLECTOR REPLACEMENT - RIGHT SIDE

Fig. 5: Underbody Front Air Deflector - Right Side

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Underbody Front Air Deflector Nut (Qty: 6) CAUTION: <u>Fastener</u> <u>Caution</u> Tighten 3 N.m (27 lb in)
2	Underbody Front Air Deflector

UNDERBODY REAR AIR DEFLECTOR REPLACEMENT

Fig. 6: Underbody Rear Air Deflector

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
<u>Underbody Front Air Deflector Replacement - Left Side</u>	
1	Underbody Rear Air Deflector Nut (Qty: 6) CAUTION: <u>Fastener</u> <u>Caution</u> Tighten 3 N.m (27 lb in)
2	Underbody Rear Air Deflector Push in Retainer
3	Underbody Rear Air Deflector Screw (Qty: 5) Tighten 2.5 N.m (22 lb in)
4	Rear Wheelhouse Liner Bolt (Qty: 3) Tighten 2.5 N.m (22 lb in)
5	Underbody Rear Air Deflector

DRIVETRAIN AND FRONT SUSPENSION CROSSMEMBER EXTENSION REPLACEMENT

Special Tools

EN-45059 Angle Meter

Equivalent regional tools: [Special Tools](#)

Removal Procedure

1. Support the radiator using mechanics wire.
2. Remove the drivetrain and front suspension cradle. [Drivetrain and Front Suspension Cradle Replacement](#)
3. Remove the front underbody air deflector. [Front Underbody Air Deflector Replacement](#)

Fig. 7: Generator Control Module Coolant Pump Bracket And Nuts

Courtesy of GENERAL MOTORS COMPANY

4. Remove the generator control module coolant pump bracket (1) from the drivetrain and front suspension cross member extension. [Generator Control Module Coolant Pump Replacement](#)

Fig. 8: Hose Clamps And Retainer
Courtesy of GENERAL MOTORS COMPANY

5. Remove the hose clamps (1, 4).
6. Disconnect the hose (2) from the clamps (3).
7. Disconnect the retainer (5) from the drivetrain and front suspension cross member extension.

Fig. 9: Heater Coolant Heater And Bolts
Courtesy of GENERAL MOTORS COMPANY

8. Remove the heater coolant heater bolts (1).

9. Support the heater coolant heater (2) with a strap or mechanics wire.
10. Disconnect all wiring harness retainers from the drivetrain and front suspension cross member extension.
11. Support the drivetrain and front suspension cross member extension using a suitable jack.

Fig. 10: Front Suspension Cross Member Extension Bolts

Courtesy of GENERAL MOTORS COMPANY

12. Remove and DISCARD the drivetrain and front suspension cross member extension bolts (1).

Fig. 11: Drivetrain And Front Suspension Cross Member Extension

Courtesy of GENERAL MOTORS COMPANY

13. Lower the drivetrain and front suspension cross member extension (1).

Installation Procedure

Fig. 12: Drivetrain And Front Suspension Cross Member Extension

Courtesy of GENERAL MOTORS COMPANY

1. Raise the drivetrain and front suspension cross member extension (1) into position.
2. Connect all wiring harness retainers to the drivetrain and front suspension cross member extension.

Fig. 13: Heater Coolant Heater And Bolts

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Fastener Caution

3. Install the heater coolant heater bolts (1) and tighten to 9 N.m (80 lb in).
4. Remove the strap or mechanics wire from the heater coolant heater.

Fig. 14: Generator Control Module Coolant Pump Bracket And Nuts
Courtesy of GENERAL MOTORS COMPANY

5. Install the generator control module coolant pump bracket (1) to the drivetrain and front suspension cross member extension. Generator Control Module Coolant Pump Replacement

Fig. 15: Hose Clamps And Retainer
Courtesy of GENERAL MOTORS COMPANY

6. Install the hose clamps (1, 4).

7. Connect the hose (2) to the clamps (3).
8. Connect the retainer (5) from the drivetrain and front suspension cross member extension.
9. Loosely install the NEW drivetrain and front suspension cross member extension bolts to support the cradle extension.
10. Install the drivetrain and front suspension cradle. [Drivetrain and Front Suspension Cradle Replacement](#)
11. Remove the jack supporting the drivetrain and front suspension cross member extension.

[Fig. 16: Front Suspension Cross Member Extension Bolts](#)

Courtesy of GENERAL MOTORS COMPANY

WARNING: [Torque-to-Yield Fastener Warning](#)

CAUTION: [Fastener Caution](#)

12. Tighten the NEW drivetrain and front suspension cross member extension bolts (1) as follows:

Tighten:

1. First Pass: 100 N.m (74 lb ft)
 2. Final Pass: 45 - 60 degrees use the **EN-45059** meter
13. Install the front underbody air deflector. [Front Underbody Air Deflector Replacement](#)
 14. Lower the vehicle. [Lifting and Jacking the Vehicle](#)
 15. Remove mechanics wire from the radiator.

DRIVETRAIN AND FRONT SUSPENSION CRADLE REPLACEMENT

Special Tools

- **EN-45059** Angle Meter
- **CH-51034** - A Cradle Alignment Pins

Equivalent regional tools: [Special Tools](#)

Removal Procedure

CAUTION: With wheels of the vehicle facing straight ahead, secure the steering wheel utilizing steering column anti-rotation pin, steering column lock, or a strap to prevent rotation. Locking of the steering column will prevent damage and a possible malfunction of the SIR system. The steering wheel must be secured in position before disconnecting the following components:

- The steering column
- The intermediate shaft(s)
- The steering gear

After disconnecting these components, do not rotate the steering wheel or move the front tires and wheels. Failure to follow this procedure may cause the SIR coil assembly to become un-centered and cause possible damage to the SIR coil. If you think the SIR coil has become un-centered, refer to your specific SIR coil's centering procedure to re-center SIR Coil.

CAUTION: Electrostatic discharge (ESD) can damage many solid-state electrical components. ESD susceptible components may or may not be labeled with the ESD symbol. Handle all electrical components carefully. Use the following precautions in order to avoid ESD damage:

- Touch a metal ground point in order to remove your body's static charge before servicing any electronic component; especially after sliding across the vehicle seat.
- Do not touch exposed terminals. Terminals may connect to circuits susceptible the ESD damage.
- Do not allow tools to contact exposed terminals when servicing connectors.
- Do not remove components from their protective packaging until required to do so.
- Avoid the following actions unless required by the diagnostic procedure:
 - Jumpering or grounding of the components or connectors.
 - Connecting test equipment probes to components or connectors. Connect the ground lead first when using test probes.
- Ground the protective packaging of any component before opening. Do not rest solid-state components on metal workbenches, or on top of TVs, radios, or other electrical devices.

NOTE: Vehicle alignment is not required if the cradle is being lowered or dropped to perform another procedure. This vehicle is equipped with a cradle to body aligning feature: cradle to body through holes or self-aligning pins that are part of the cradle or body. Only align if replacing the cradle with a **NEW** part and transferring components.

1. Disable the high voltage system. [High Voltage Disabling](#)
2. Disconnect the steering intermediate shaft from the steering gear. [Intermediate Steering Shaft Replacement](#)
3. Remove the front tire and wheel assemblies. [Tire and Wheel Removal and Installation](#)
4. Remove Front Wheelhouse Liner [Front Wheelhouse Liner Replacement \(Left Side\)](#)[Front Wheelhouse Liner Replacement \(Right Side\)](#)
5. Remove Front Underbody Air Deflector [Front Underbody Air Deflector Replacement](#)

Fig. 17: Radiator Air Side Baffle Bolt And Radiator Air Lower Baffle Bracket
Courtesy of GENERAL MOTORS COMPANY

6. Remove Radiator Air Side Baffle Bolt (1) @ Radiator Air Lower Baffle Bracket (2)

Fig. 18: Drivetrain And Front Suspension Crossmember Extension Fasteners

39. Remove Transmission Mount Strut (1)
40. Transfer components as necessary.

Installation Procedure

Fig. 33: Transmission Mount Strut And Bolt

Courtesy of GENERAL MOTORS COMPANY

1. Install Transmission Mount Strut (1)

WARNING: [Torque-to-Yield Fastener Warning](#)

CAUTION: [Fastener Caution](#)

2. Install New Transmission Mount Strut Bolt (2)[Transmission Mount Strut Replacement](#)

[Fig. 34: Front Lower Control Arm, Bushing Bolts And Nuts](#)

Courtesy of GENERAL MOTORS COMPANY

3. Install Front Lower Control Arm (4)

WARNING: [Torque-to-Yield Fastener Warning](#)

4. Install New Front Lower Control Arm Rear Bushing Bolt (3)[Lower Control Arm Replacement](#)

5. Install New Front Lower Control Arm Rear Bushing Nut (2)[Lower Control Arm Replacement](#)

WARNING: [Torque-to-Yield Fastener Warning](#)

6. Install New Front Lower Control Arm Bushing Bolt (1)[Lower Control Arm Replacement](#)

Fig. 35: Steering Gear Bolt And Electric Belt Drive Rack and Pinion Steering Gear
 Courtesy of GENERAL MOTORS COMPANY

NOTE: Install one new bolt (4), washer (2) and nut (1) loosely, on the right side to allow steering gear to pivot on cradle during drivetrain and front suspension cradle installation.

7. Install Electric Belt Drive Rack and Pinion Steering Gear ((3)
8. Install the 1 washer (2) to the electric belt drive rack and pinion steering gear.
9. Install Steering Gear Nut (1) @Electric Belt Drive Rack and Pinion Steering Gear
10. Install Steering Gear Bolt(4) @Electric Belt Drive Rack and Pinion Steering Gear (3)[Electric Belt Drive Rack and Pinion Steering Gear Replacement](#)

Fig. 36: Stabilizer Shaft And Bolts

Courtesy of GENERAL MOTORS COMPANY

11. Install Stabilizer Shaft (2)
12. Install Stabilizer Shaft Bracket Bolt (1) and tighten the NEW bolt. [Stabilizer Shaft Replacement](#)

Fig. 37: Steering Column Dash Outer Seal

Courtesy of GENERAL MOTORS COMPANY

13. Make sure the notch in the steering column dash outer seal (1) is still correctly aligned to the nose on the electric belt drive rack and pinion steering gear.

NOTE: Pivot the electric belt drive rack and pinion steering forward as the drivetrain and front suspension cradle is being raised up to the vehicle. Insert the front horns of the drivetrain and front suspension cradle extension as the drivetrain and front suspension cradle gets closer to the body. Once the drivetrain and front suspension cradle is inserted into the drivetrain and front suspension cradle extension, pivot the steering gear rearward so steering shaft goes up into the floor as the cradle is raised up to the vehicle.

14. Raise the drivetrain and front suspension cradle to the vehicle.

Fig. 38: Drivetrain And Front Suspension Crossmember Extension Fasteners
 Courtesy of GENERAL MOTORS COMPANY

15. Install New Insert NEW Drivetrain and Front Suspension Crossmember Extension Rear Bolt (2)
16. Install New Drivetrain and Front Suspension Cradle Nut (1)

Fig. 39: Electric Belt Drive Rack And Pinion Steering Gear, Bolts, Nuts And Washers
 Courtesy of GENERAL MOTORS COMPANY

17. Install the two washers (2) to the electric belt drive rack and pinion steering gear.
18. Install the remaining steering gear bolts (4), washers (2) and nuts (1). **Electric Belt Drive Rack and Pinion Steering Gear Replacement**

Fig. 40: Power Steering Assist Motor And Electrical Connectors

- **EN-45059** Angle Meter
- **CH-51034** - A Cradle Alignment Pins

Equivalent regional tools: [Special Tools](#)

Removal Procedure

CAUTION: With wheels of the vehicle facing straight ahead, secure the steering wheel utilizing steering column anti-rotation pin, steering column lock, or a strap

to prevent rotation. Locking of the steering column will prevent damage and a possible malfunction of the SIR system. The steering wheel must be secured in position before disconnecting the following components:

- The steering column
- The intermediate shaft(s)
- The steering gear

After disconnecting these components, do not rotate the steering wheel or move the front tires and wheels. Failure to follow this procedure may cause the SIR coil assembly to become un-centered and cause possible damage to the SIR coil. If you think the SIR coil has become un-centered, refer to your specific SIR coil's centering procedure to re-center SIR Coil.

CAUTION: Electrostatic discharge (ESD) can damage many solid-state electrical components. ESD susceptible components may or may not be labeled with the ESD symbol. Handle all electrical components carefully. Use the following precautions in order to avoid ESD damage:

- Touch a metal ground point in order to remove your body's static charge before servicing any electronic component; especially after sliding across the vehicle seat.
- Do not touch exposed terminals. Terminals may connect to circuits susceptible the ESD damage.
- Do not allow tools to contact exposed terminals when servicing connectors.
- Do not remove components from their protective packaging until required to do so.
- Avoid the following actions unless required by the diagnostic procedure:
 - Jumpering or grounding of the components or connectors.
 - Connecting test equipment probes to components or connectors. Connect the ground lead first when using test probes.
- Ground the protective packaging of any component before opening. Do not rest solid-state components on metal workbenches, or on top of TVs, radios, or other electrical devices.

NOTE: Vehicle alignment is not required if cradle is being lowered or dropped to perform another procedure. This vehicle is equipped with a cradle to body aligning feature: cradle to body through holes or self-aligning pins that are part of cradle or body. Only align if replacing the cradle with NEW part and transferring components.

1. Disable the high voltage system. [High Voltage Disabling](#)
2. Disconnect the steering intermediate shaft from the steering gear. [Intermediate Steering Shaft](#)

Replacement

3. Remove the front tire and wheel assemblies. [Tire and Wheel Removal and Installation](#)
4. Remove Front Wheelhouse Liner [Front Wheelhouse Liner Replacement \(Left Side\)](#)[Front Wheelhouse Liner Replacement \(Right Side\)](#)
5. Remove Front Underbody Air Deflector [Front Underbody Air Deflector Replacement](#)

INTRODUCTION

BASECOAT/CLEARCOAT PAINT SYSTEMS

WARNING: Exposure to isocyanates during paint preparation and application processes can cause severe breathing problems. Read and follow all of the instructions from the

manufacturers of painting materials, equipment, and protective gear.

All paint finish repairs of rigid exterior surfaces must meet GM standards. Refer to the latest revision of the GM Approved Refinish Materials book to identify the paint systems you may use that have been engineered to meet GM standards. The GM Approved Refinish Materials book supplies all approved products, including volatile organic compound (VOC) compliant regulations recommended by the individual manufacturer, and detailed procedures for materials used in their paint system.

The latest revision of the GM Approved Refinish Materials booklet is located on the Genuine GM Parts website at www.genuinegmparts.com.

ANTI-CORROSION TREATMENT AND REPAIR

Corrosion Preventative Paint (Chassis Coating) and Primer Coatings

NOTE: Always use these products according to their manufacturer's recommendations. Corrosion Resistant paint and primers will only function properly when mixed properly and when applied to a properly prepared metal surface. Always follow paint manufacturers recommendations for application and use of Corrosion Preventative Paint Products.

Corrosion Preventative Primers are also referred to as Direct to Metal or DTM primers. Extensive testing is done for corrosion resistance and adhesion of these products. Most paint manufacturers require a bare metal treatment chemical first be applied before the paint or primer product is applied. These coatings are very important to providing a properly prepared metal surface for the paint or primer to perform properly. The GM Approved Primers are listed in the GM Approved Refinish Materials book. The latest revision of the GM Approved Refinish Materials booklet is located on the GM Genuine Parts website at www.genuinegmparts.com.

Corrosion Preventative Paint Products are recommended for under-carriage areas like frames, drive line and suspension components that often show corrosion and need to be painted in the field. Any place where bare metal is exposed for stud repair or where corrosion prevention is desired from a paint like product that will not likely be top coated with color can use this Corrosion Preventative Paint. A Phosphate metal treatment MUST be applied to the cleaned and dried surface that is free of corrosion scale. This Phosphate prep works well on both Aluminum and steel. While sandblasting can be performed for corrosion removal, it is not necessary for these products to work properly. Application of this product must be performed to Manufacturer's recommendations for them to work properly. See product listing below for Corrosion Preventative Paint Products.

Stock number	Type	Description
36500 or 36502	Kryptonite Solvent Based Chassis Coating	Solvent based rust protective coating for all areas of under vehicle corrosion protection on aluminum and steel.
25418	Pure Prep Phosphate Metal Treatment	Phosphate bare metal treatment for metal preparation of clean or oxidized metal surfaces, areas of under vehicle corrosion protection on aluminum and steel

Undercoating and Closed Cavity Coatings

WARNING: When applying sound deadeners, or anti-corrosion materials due care and preventative measures must be exercised to prevent any material from being sprayed into door and quarter panel mechanisms such as door locks, window run

channels, window regulators and seat belt retractors, as well as any moving or rotating mechanical or suspension parts on the underbody, particularly the parking brake cable. After material application, be sure that all body drain holes are open. Improper application may increase chance of corrosion damage or limit the operation of moving parts, resulting in personal injury.

Any procedure that disturbs these special treatments, such as panel replacement or collision damage repair operations, may leave the metal unprotected and result in corrosion. Proper recoating of these surfaces with service-type anti-corrosion material is essential.

After repair and/or replacement parts are installed, all accessible bare metal surfaces must be treated with metal conditioner and reprimed. Refer to the GM Approved Refinish Materials book which identifies the paint systems you may use.

The latest revision of the GM Approved Refinish Materials booklet is located on the GM Genuine Parts website at www.genuinegmparts.com.

After a collision, some vehicle structure areas such as frame rails, cross-members and rocker panel sections may need to be repaired. In most cases, the anti-corrosion materials need to be removed to perform these repairs. These materials are classified into two types: Closed Cavity coatings and Undercoat coatings. The primary difference is the way the products set up or "dry". Both are intended to protect the surface they are applied to from corrosion caused by water, salt water or Magnesium Chloride blended de-icing compounds used to thaw icy winter roads. They also can provide a measure of sound deadening.

The Closed Cavity coatings remain sticky to the touch and will seep into seams initially and over extended periods of time. Closed Cavity coatings provide the best corrosion protection inside of rocker panel sections, pillar sections, frame rails, cross-members, doors, rear compartment lids and closed areas of hoods - anywhere that is concealed or closed off to exterior surfaces.

The Undercoat coatings are "dry to the touch" and offer the best corrosion protection and sound deadening for floor pans, wheelhouses, inside rear compartment and underhood areas - anywhere the coated surface is exposed.

Below is a listing of Undercoat coatings and Closed Cavity coatings that GM believes to be reliable. While others may exist, we have found these products, or equivalents to them, can be used with satisfactory results. Always use these products according to their manufacturer's recommendations.

The following products are available from *Automotive International/Valugard. Contact them at 1-800-543-7156, or at www.valugard.net

Stock number	Type	Description
VG-104	WAX/SOLVENT BASED UNDERCOAT	Traditional Wax/Solvent based Undercoating available in aerosol or spray gun canister Meets OE specifications for corrosion resistance
VG-076M	HYBRID (SOLV./WATER) UNDERCOAT	Meets OE specifications for corrosion resistance
VG-140	WATER BASED UNDERCOAT	Meets OE specifications for corrosion resistance
VG-101	WAX BASED CLOSED CAVITY COATING	Meets OE specifications for corrosion resistance
VG-UCG	CANISTER UNDERCOATING GUN	High quality undercoating gun uses canister packaging of undercoating

Stock number	Type	Description
VG-CRG	CANISTER CLOSED CAVITY COATING GUN	High quality closed cavity coating gun uses canister packaging of coating and comes with 30 in inner panel application tube with nozzle

The following products are available through your local *3M[®] distributor. Information about 3M[®] product retailers in your area may be obtained at 1-866-364-3577 or at www.mmm.com/automotive.

Stock number	Type	Description
08804	No Cleanup Water-Based Undercoating - Black	Coarse texture SBR rubber and acrylic applied with 3M No-Cleanup Gun 08801
08964	No Cleanup Undercoating - Black	Smooth texture SBR rubber applied with 3M No-Cleanup Gun 08801
08881	16 oz aerosol Undercoating	Calcium Carbonate and asphalt based undercoating
08882	17 oz aerosol Underseal [™] Undercoating - Black	Rubber based, paintable undercoating
08883	19.7 oz aerosol Rubberized Undercoating - Black	Synthetic polymer based undercoating
08891	Rust Fighter - 1 Amber Closed Cavity Coating - quart canister	Synthetic Resin remains tacky seeps into crevices; Applied with 3M Applicator Gun 08997 and Application Wand 08998
08892	Rust Fighter - 1 Amber Closed Cavity Coating - 24 oz aerosol	Synthetic Resin remains tacky seeps into crevices; aerosol can
08801	No Cleanup Undercoating Gun	-

The following products are available from *Crest Industries, Inc. at 1-800-822-4100 or www.crestaauto.com.

Stock number	Type	Description
AH-C	HONEY COAT/WAX BASED CLOSED CAVITY COATING	16.5 OZ AEROSOL CAN AMBER COLORED SEEPS INTO CREVICES AND REMAINS PLIABLE 36 in spray wand with 360 degree nozzle available (WA-HC)
BZ-BAC BZ-BACB	AMBER COAT/WAX BASED CLOSED CAVITY COATING	GALLON - AMBER COLORED (BZ-BAC) OR BLACK (BZ-BACB) SEEPS INTO CREVICES AND REMAINS PLIABLE APPLIED WITH WZ-GRP GUN AND SIPHON HOSE Flexible spray wand also available (WA-ND)
AC-R	RUBBER COAT/RUBBER BASED UNDERCOATING, PAINTABLE	17.75 OZ AEROSOL
AR-C	SUPER RUBBER COAT/LOW V.O.C. RUBBER BASED UNDERCOATING, PAINTABLE	17.75 OZ AEROSOL
BA-C	AUTO COAT/RUBBER BASED UNDERCOATING, PAINTABLE	28.7 FL OZ CONE-TOP CAN AND GALLON APPLIED WITH GU-C UNDERCOATING GUN
GU-C	UNDERCOATING GUN	ATTACHES TO BA-C CONE-TOP CAN

Stock number	Type	Description
WZ-GRP	GUN AND SIPHON HOSE	USED WITH BZ-BAC AND BZ-BACB
WA-ND	FLEXIBLE SPRAY WAND	USED WITH WZ-GRP

The following products are available from *Kent Automotive. Contact them at 1-888-YES-KENT (888-937-5368) or at www.kent-automotive.com.

Stock number	Type	Description
P60305	Wax Based Inner Panel Rustproofers - CLOSED CAVITY COATING	24 oz Aerosol (can apply with 36 in wand and 360 degree nozzle kit)
KT14912	Rubber Guard Low VOC Rubber Based Undercoating	24 oz Aerosol (can apply with 36 in wand and 360 degree nozzle kit)
KT14725	Aerosol Extension Wand Kit	36 in wand and 360 degree nozzle
KT14796	Rubber Guard Low VOC Rubber Based Undercoating	QUART - Applied with undercoating gun
P30025	Siphon Feed Gun	-
P86079	360 Degree Wand for siphon feed gun	-

Weld Thru Coating

Part Number	Description
4353	Weld-Through Primer

*We believe these sources and their products to be reliable. There may be additional manufacturers of such material. General Motors does not endorse, indicate any preference for or assume any responsibility for the products from these firms or for any such items which may be available from other sources.

Seam Sealers

Sealers are intended to prevent water and dust from entering the vehicle and also are anti-corrosion barriers. Sealers are applied to such areas as rear compartment lid hem flanges, wheelhouse, quarter outer, floor, cowl, roof, and various other panel to panel attaching points. The originally sealed joints are obvious and any damage to these sealed locations should be corrected by resealing. Attaching points of new replacement panels should be resealed. Replacement lids and doors will also require sealing in the hem flange areas.

Flanged joints, overlap joints, and seams should be sealed using a quality sealer of medium-bodied consistency. The sealer used must retain its flexible characteristics after curing and be paintable.

Open joints which require bridging of the sealer in order to close a gap should be sealed using a heavy-bodied caulking material. Follow the label directions for the material selected.

Color application may be required in order to restore repaired areas such as hood, fenders, doors, quarters, lid, roof, engine compartment, underbody, and inner panels to original appearance. When this is necessary, conventional refinishing preparation, undercoat buildup, and color application techniques should be followed.

Deadener materials, spray-on type, are used on various metal panels in order to provide corrosion resistance and joint sealing. They control the general noise level inside the passenger area of the vehicle. When deadeners are disturbed because of damage, are removed during repair operations, or a new replacement panel is installed, the

deadener material must be replaced by a service equivalent material. The application pattern and location of deadener materials can be determined by observing the original production installation.

Cleaning of the interior and underbody panel surfaces is necessary when original galvanized or other anti-corrosion materials have been burned off during welding or heating operations. Removal of the residue from burning will require additional care in such areas as interior surfaces of box-type construction and when configurations of the metal panels limit access to interior surfaces.

PAINT IDENTIFICATION

WARNING: Exposure to isocyanates during paint preparation and application processes can cause severe breathing problems. Read and follow all of the instructions from the manufacturers of painting materials, equipment, and protective gear.

NOTE: Always refer to the GM Approved Refinish Materials book. This book identifies the paint systems you may use.

The latest revision of the GM Approved Refinish Materials booklet is located on the Goodwrench website at www.gmgoodwrench.com.

Use the service parts identification label to identify the type of paint technology, paint codes, trim level, and any special order paint colors on the vehicle. Refer to [Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label](#).

REPAIR INSTRUCTIONS

CLEARCOAT REPAIR WITHOUT REPAINTING

Repair Procedure

1. Thoroughly wash the repair area with Liquid Wash and Wax GM P/N 1052870 or the equivalent.
2. Environmental damage may be corrected. Refer to [Environmental Fallout \(Acid Rain\)](#), or [Rail Dust Damage Repair](#).

IMPORTANT: Follow all of the instructions from the manufacturer of the polishing material.

3. Use a paint gauge before, during, and after sanding and/or polishing, to avoid removing too much clearcoat. Refer to [Paint Gauges](#).

ENVIRONMENTAL FALLOUT (ACID RAIN)

CAUTION: Refer to [Clearcoat/Ultraviolet Screeners Caution](#).

NOTE: Always refer to the manufacturer's packaged instructions for the detailed procedures of materials used for compounding and/or polishing.

Since the severity of the condition varies from area to area, proper diagnosis of the contamination extent is critical to the success of the repairs. Perform the diagnosis under high intensity fluorescent lighting on the horizontal surfaces (hood, roof panel, rear compartment lid), after the surfaces have been properly cleaned by washing the vehicle with GM Wash and Wax GM P/N 1237841 (Canadian P/N 10953203), or equivalent.

There are 3 basic types of acid rain damage:

Surface Level Contamination

May be repaired by simply washing the vehicle, cleaning the surface with a silicone wax and grease remover, neutralizing acidic residue, and finesse polishing - Refer to Surface Level Contamination Repair.

Clearcoat Etching

Slight etching is still noticeable after the above washing and finesse polishing procedure. Refer to Slight Clearcoat Damage - Wet Sanding, Finesse Polishing.

Basecoat Etching

Severe etching beyond the clearcoat into the basecoat in the affected areas will require refinishing. Refer to [Basecoat/Clearcoat Paint Systems](#).

Surface Level Contamination Repair

1. Thoroughly wash and dry the contaminated area with GM Wash and Wax GM P/N 1237841 (Canadian P/N 10953203), or equivalent.
2. Clean the affected area with silicone, wax and grease remover.
3. Remove and neutralize acidic residue by cleaning the contaminated areas with a mixture of baking soda and water (1 tablespoon of baking soda per 1 liter or 1 quart of water). Rinse thoroughly and dry the panel completely.
4. Apply finesse-type polish with a foam panel. If damage has been repaired, remove any swirl marks with a dual action orbital polisher and foam pad. Refer to [Clearcoat Repair Specifications - 3M Products](#).
5. If some damage remains, refer to Slight Clearcoat Damage - Wet Sanding, Finesse Polishing.

Slight Clearcoat Damage - Wet Sanding, Finesse Polishing

1. Select a small contaminated test area.
2. Film thickness should be taken prior to the sanding and polishing. Refer to [Paint Gauges](#).
3. Wet sand and finesse polish the contaminated test area. Refer to [Clearcoat Repair Specifications - 3M Products](#). If during the polishing you suspect or observe that etching has penetrated into the basecoat, too much clearcoat has been removed during sanding, or base color is transferred to the polishing pad during polishing, then the affected areas will require refinishing. Refer to [Basecoat/Clearcoat Paint Systems](#).

PAINT GAUGES

Paint thickness gauges measure the total thickness of the vehicle finish. It is important to accurately measure the thickness of the finish on each vehicle as the thickness of the finish will vary on each vehicle. Use a paint gauge before the sanding process in order to accurately measure how much finish there is to remove before, during, and after the sanding process. Paint gauges range from magnetic pull type to sophisticated electronic types, and are available from a variety of sources. The older magnetic type gauges, at best have a 5 percent accuracy range and are not sensitive enough to detect removal of 0.02 mm 0.5 mil (0.0005 in) clearcoat. The newer type magnetic gauges have improved accuracy ranges. Most gauges are confined to checking either ferrous metal, steel, non-ferrous metal, or aluminum panel. At this time, there are no viable gauges for reading film thickness on composite (SCM doors, RIM fenders) panels. The more sophisticated (ETG) electronic paint thickness gauges digital type gauges are able to read film thickness on both ferrous and non-ferrous metal panel. Digital ETG gauges may have

an accuracy range of 1 percent and include thickness standards for recalibration. The following paint thickness gauges are available. Call 1-800-GM-TOOLS for information:

Paint Thickness Gauges

- 147-5437-ETG Standard model
- 147-5437-ETG-P Standard model with print option
- 147-5437-N-ETG-N Non-ferrous model for aluminum panels
- 147-5437-NP-ETG-NP Non-ferrous model with print option
- 147-54437-SD-ETG Steel and aluminum gauge

CLEARCOAT THICKNESS

The clearcoat on the vehicle is typically 0.059 - 0.078 mm (1.5 - 2 mils [0.0015 - 0.0020 in]) thick. The clearcoat contains ultraviolet screeners. Removing more than 0.5 mils (0.019 in) of the clearcoat may result in early paint failure.

RAIL DUST DAMAGE REPAIR

WARNING: Refer to [Eye Protection Warning](#) .

NOTE: If rail dust has penetrated into the basecoat, the panel requires refinishing. Ensure all the rail dust has been removed prior to refinishing or the rust spots will return.

Rail dust damage comes from the tiny iron particles produced from the friction between the train wheels and the track. It can also be deposited on vehicles if stored near any operation producing iron dust (i.e., steel ore yards). This dust can either lay on top of, or embed into the paint surface. It is usually diagnosed as bumps in the paint surface or rust colored spots in the paint.

1. Move the vehicle to a cool shaded area and ensure the vehicle surfaces are cool during the removal process.
2. Thoroughly wash the repair area with Liquid Wash and Wax GM P/N 1052870, or equivalent.
3. Wipe the area dry.
4. Clean the affected area with silicone, wax and grease remover.
5. Perform the removal process according to the manufacturer's directions of the type of repair material used (Gel Type Oxalic Acid or Clay Type Non-Acid Based). If, upon inspection, some particles are still present, the process may be repeated. If the damage has been repaired, complete the repair to the entire panel.
6. Polish the entire panel after the removal process. Refer to [Clearcoat Repair Specifications - 3M Products](#). If small pits remain in the clearcoat after all of the damage has been repaired, refer to [Clearcoat Repair without Repainting](#).

REPAIR INSTRUCTIONS

GENERAL PLASTIC REPAIR

WARNING: In order to reduce the risk of personal injury when exposed to toxic fumes while grinding, cutting, or applying repair material on any type of sheet molded compound or RIM rigid plastic, observe the following guidelines:

- Work in a properly ventilated area
- Apply protective cream to any exposed skin
- Remove any mixture that comes into contact with skin
- Wash skin with cold water to remove glass and resin dust
- Use a sander with a vacuum attachment
- Follow the repair material manufacturer's instructions

Also, always wear the following:

- An approved respirator, or air supplied respirator
- Eye protection
- Rubber gloves
- Earplugs
- Protective clothing

The following procedures should be followed when repairing all types of thermoset plastic:

- Follow the manufacturer's application and curing recommendations.
- Do not intermix systems. Use the supplies and the repair materials from the same manufacturer.
- Clean the inner and outer surfaces of the repair area with a soap impregnated scouring pad in order to remove any dirt or mold release agent.
- Clean the area with a wax and grease remover, using only enough of the remover to dampen a cloth. Allow the panel to dry thoroughly.
- Remove the surface finish from the area to be repaired. Adhesives are designed to adhere to the plastic substrate, not the finish.
- Prime a metal surface before applying the repair material.
- Inspect the rear side of the work area before making repairs in order to avoid possible damage to wires, motors, etc.

DESCRIPTION AND OPERATION

HOW TO IDENTIFY PLASTIC PARTS

Fig. 1: Identifying SAE Code

Courtesy of GENERAL MOTORS COMPANY

Plastic parts can be identified by the SAE code, which is usually found on the rear of the part, and/or by the characteristics of the plastic. Knowing the type of plastic aids in selecting the proper repair materials and in selecting the proper repair procedure.

Look for the SAE code stamped into the part.

Code Found

Match the code to those in the plastic identification chart to determine whether the plastic is thermoplastic or thermoset plastic, and whether the plastic is rigid or flexible. Refer to [**Plastic Identification and Refinishing Systems**](#).

No Code Found

WARNING: Do NOT use a plastic burn test to distinguish the type of plastic. The burn test produces vapors which are harmful.

Perform one or both of the following tests to determine if the part is thermoplastic polyolefin or thermoset non-polyolefin.

Float Test

1. Cut a shaving of plastic from the back of the part.

The shaving should be free of mold release agents and paint.

2. Place the shaving in a container of water.

- Thermoplastic polyolefin floats.
- Thermoset non-polyolefin sinks.

Abrasion Test

- Sand a spot near the damaged area with Grade 36 Roloc Disc.
- Thermoplastic polyolefin material melts or frays when sanded.
- Thermoset non-polyolefin material sands cleanly.

Thermoplastic and thermoset plastics can be either rigid or flexible. Thermoplastic plastic parts are best repaired with a hot iron plastic material-feed welder, but are usually replaced. Thermoset plastic can be repaired with epoxy or other more rigid 2 package repair material.

- For rigid thermoset repair materials, refer to [Rigid Plastic Part Repair Materials](#).
- For flexible thermoset repair materials, refer to [Flexible Plastic Part Repair Materials](#).
- For general repair instructions, refer to [General Plastic Repair](#).

PLASTIC IDENTIFICATION AND REFINISHING SYSTEMS

Identifying Symbol - Old Symbol in (s)	Chemical Composition or Plastic Family Name	Typical Area(s) Where Part is Used	Examples of Common / Trade Names	Type of Plastic
ABS	Acrylonitrile / Butadiene-Styrene	Armrest Support, Console, IPC, Steering Column Bracket / Jacket, Trim Molding	ABS, Absafil, Magnum, Cyclocac, Dyel, Kralastic, Lustran	Thermoplastic
ABS + PC	Acrylonitrile / Butadiene-Styrene + Polycarbonate	Instrument Panel, IPC	Bayblend, Cycloy, KHA, Pulse	Rigid
ABS / PVC	ABS/Vinyl (Soft)	Head Rest Cover, Instrument Panel Pad, Trim Molding / Panel	ABS Vinyl	Flexible, Vinyl
EPDM	Ethylene Propylene Diene Monomer	Body Panel, Bumper Impact Strip	EPDM, Nordel	Rigid

Identifying Symbol - Old Symbol in (s)	Chemical Composition or Plastic Family Name	Typical Area(s) Where Part is Used	Examples of Common / Trade Names	Type of Plastic
EVA (EVAC)	Ethylene / Vinyl Acetate	Head Rest Cover, Misc Soft Trim	Elvax, Microthane	Flexible
PA	Polyamide	Headlamp Bezels, Quarter Panel Extensions, Exterior Finish Trim Panels	Nylon, Capron, Zytel, Rilsan, Minion, Vydyne, Welland	Rigid
PA, PAG, PAGG	Polyamide	Exterior Finish Trim Panel, Headlamp Bezel, Quarter Panel Extension	Capron, Minlon, Nylon, Rilsan, Vydyne, Wellamid, Zytel	Rigid, Thermoset
PA + PPE	Polymide + Polyphenylene Ether	Exterior Trim, Fender	GTX	Rigid, Thermoset
PBT + TEEE (PBTP + EEBC)	Polybutylene, Terephthalate + Ether, Ester Block Compound	Fascia, Rocker Panel Molding	Bexloy M	Rigid
PC	Polycarbonate	Interior Rigid / Hard Trim Panel, Valance Panel	Calibre, Lexan, Merlon, Makrolon	Rigid, Thermoset
PC + PETP	Polycarbonate + Polybutylene, Terephthalate	Bumper Fascia	Macroblend, Valox, Xenoy	Flexible, Thermoset
PE	Polyethylene	Fuel Tank Shield, Inner Fender Panel, Interior Trim Panel, Seat Belt Cover, Spoiler, Valance	Alathon, Dylan, Foriflex, Hi-fax, Hosalen, Marlex, Paxon	Rigid, Thermoplastic
PF	Phenol Formaldehyde	Ashtray	Amberol, Bakelite, Durez, Genal, Phenolic, Plyophen, Resinox	Rigid, Thermoset
PP	Polypropylene	Bumper Fascia, Cowl Panel, Deflector Panel, Door Panel, Inner Fender, Interior Molding, Kick Panel, Load Floor, Radiator Shroud, Wheel Cover	Azdel, Daplen, Escorene, Marlex, Novolen, Oleflo, Profax, Tenite	Flexible, Thermoplastic
PPE (PPO)	Polyphenylene Ether	Bezels, Chromed Plastic, Headlamp Door, Ornaments	Noryl, Oleflo, Prevex	Rigid, Thermoset

Identifying Symbol - Old Symbol in (s)	Chemical Composition or Plastic Family Name	Typical Area(s) Where Part is Used	Examples of Common / Trade Names	Type of Plastic
PS	Polystyrene	Dash Panel, Door Panel	Durathon, Dylan, Lustrex, Polystyrol, Styron	Flexible, Soft
PUR	Polyurethane, Thermoset (Unsaturated)	Bumper Fascia, Filler Panel, Front/Rear Body Panel, Pickup Box	Bayflex, Castethane, RIM, RRIM, SRIM	Thermoset
PVC	Polyvinyl Chloride (Vinyl)	Interior Soft Trim, I/P Skins, Roof Cover	Geon, Pliovic, Unichem, Vinoflex, Vinyl, Vinylite	Flexible, Vinyl
SAN (SA)	Styrene Acrylonitrile	Center Console, Glove Box Door, Interior Trim Panel	Foracryl, Lustran, Tyril	Rigid
TEO (EP, EPM, TPO)	Ethylene / Propylene (Rubber)	Air Dam, Bumper Fascia, Valance Panel	EPI, EPII, TPO, TPR (Thermoplastic Rubber)	Flexible, Thermoplastic
TPO	Thermal Plastic Oletin	Bumper Covers	TPO	Flexible Thermoplastic
TPU (TPUR)	Polyurethane, Polyolefin	Bumper Fascia, Gravel Deflector, Soft Filler Panel, Window Molding	Estane, Pellethane, Roylar, Toxin	Flexible, Thermoplastic
UP	Polyester / Thermoset	Air Scoop, Air Spoiler, Fascia Extension, Hood, Instrument Housing, Rear Compartment Lid, Roof, Ventilation Grid	Fiberglass, Premiglass, Selectron, SMC, Vibrinmat	Rigid, Thermoset

ACCESSORIES & EQUIPMENT

Squeaks and Rattles - Volt

DIAGNOSTIC INFORMATION AND PROCEDURES

SQUEAKS AND RATTLES

Special Tools

- CH-39570 Chassis Ear
- GE-41416 Ultrasonic Leak Detector

For equivalent regional tools, refer to [Special Tools](#).

NOTE: Squeaks and rattles are caused by improperly controlled relative motion between vehicle components. There are 4 ways to prevent squeaks and rattles.

To aid in diagnosing, use CH-39570 ear or GE-41416 detector.

- Attach the component that squeaks or rattles securely.
- Separate the components that squeak or rattle to prevent contact.
- Insulate the components that squeak or rattle.
- Insulate low uniform friction surfaces to eliminate stickslip motion.

GENERAL INFORMATION

Waterleaks - Volt

DIAGNOSTIC INFORMATION AND PROCEDURES

WATERLEAK TEST PREPARATION

- GM vehicles are designed to operate under normal environmental conditions.
- The design criteria for sealing materials and components takes into consideration the sealing forces required to withstand the natural elements. These specifications cannot take into consideration any artificial conditions, i.e., high pressure car washes.
- The water leak test procedure has been correlated to the natural elements and will determine the ability of a vehicle to perform under normal operating conditions.
- The first step in diagnosing a leak is determining the conditions under which a leak occurs. If the general leak area can be found, the exact entry point can be isolated using a water hose or an air hose. Some trim panels or components may need to be removed in order to repair the leak.
- If leaks are found around a door, door window, rear compartment lid or liftgate area this does not necessarily indicate a bad weatherstrip. An adjustment to these areas may resolve the condition.

1. Watertest Stand Assembly

Fig. 1: View Of Watertest Stand Assembly
Courtesy of GENERAL MOTORS COMPANY

Assemble the water test stand as shown.

Callout	Component Name
1	Pipe (0.5 x 36 in)

Callout	Component Name
2	Reducing Tee, Right Stand Only (0.5 x 0.5 x 0.25 in)
3	Coupling, Left Stand Only, (0.5 in)
4	Tee, Left Stand Only (0.5 in)
5	Cross, Right Stand Only (0.5 in)
6	Pipe to Hose Nipple, Right Stand Only (0.5 in)
7	Female Hose Coupling (5/8 in)
8	Input Hose, Right Stand Only (2.0 ft) (5/8 in diameter)
9	Close Nipple (0.5 in)
10	Cross (0.5 in) with Weld-On Cap (0.5 in)
11	Nipple (0.5 x 12 in)
12	Cap (0.5 in)
13	Female Hose Coupling (5/8 in)
14	Cross Hose (12 ft) (5/8 in diameter)
15	Hose Quick Connect
16	Pipe to Hose Nipple (0.5 in)
17	Pipe (0.5 x 60 in)
18	Water Pressure Gauge, Right Stand Only
19	Full Jet Spray Nozzle, No. 1/2GG-25 or Equivalent
20	Coupling (0.5 in)

Fig. 2: Illustrating How Water Spray From Stands Should Overlap Vehicle
Courtesy of GENERAL MOTORS COMPANY

2. Position the stands as shown.

The water spray from the stands should overlap the vehicle as shown.

3. Have an assistant inside of the vehicle during the test in order to locate any leaks.

4. The water pressure at the nozzle should maintain a 155 kPa (22 psi), for at least 4 minutes.

Fig. 3: Identifying Proper Water Spray Angles
Courtesy of GENERAL MOTORS COMPANY

5. In order to check the windshield, aim the water spray 30 degrees down and 45 degrees toward the rear.
Aim the water towards the corner of the windshield.
6. In order to check the side windows for leaks, position the water stand towards the center of the rear quarter, aiming the water spray 30 degrees down and 45 degrees toward the rear.
7. In order to check the back window, aim the water spray 30 degrees down and 30 degrees toward the front.

DUST LEAKS

Dust may leak into the vehicle where water will not. This happens particularly in the lower portion of the interior.

Forward motion of the vehicle can create a slight vacuum which pulls air and dust into the vehicle.

In order to determine the location of dust leaks, perform the following steps:

1. Remove the mats from the floor.
2. Remove the mats from the kick panel.
3. Remove the insulation from the floor.
4. Remove the insulation from the kick panel.
5. Drive the vehicle on a dusty road.
6. Examine the interior.

Dust in the shape of a small cone or slit will usually be found at the point of leakage.

7. Mark the points of leakage.

NOTE: **Ensure that the interior is darkened when performing this step.**

8. Shine bright lamps on the underside of the floor and the cowl.
9. Have an assistant mark any points inside of the vehicle for any points where the light shines through.
 - Inspect the weld joints.
 - Inspect the body mounts.
10. Seal any leaks with an air-drying, body-sealing compound.

WATER HOSE TEST

Fig. 4: Performing Water Hose Test

Courtesy of GENERAL MOTORS COMPANY

NOTE: Use a water hose without the nozzle attached.

1. Have an assistant inside of the vehicle in order to locate the leak.
2. Begin testing at the base of the window or the windshield.
3. Slowly move the hose upward and across the top of the vehicle.

AIR HOSE TEST

Fig. 5: Performing Air Hose Test

Courtesy of GENERAL MOTORS COMPANY

CAUTION: The air hose test should only be used on fully cured urethane adhesive. Otherwise, damage to the urethane adhesive bead could result in additional leaks.

1. Using a liquid detergent, diluted with water in a spray bottle, spray the window at the edges. Begin at the bottom and gradually move up and across the top.

NOTE: The compressed air should not exceed 205 kPa (30 psi).

2. Have an assistant inside of the vehicle with an air hose.
3. Have the assistant aim the compressed air at the suspected areas.

Bubbles will form in the soap solution at the location of the leak.

REPAIR INSTRUCTIONS

BODY WATERLEAK REPAIR

Fig. 6: Cutting Out Adhesive Caulking (1 Of 2)

Courtesy of GENERAL MOTORS COMPANY

WARNING: If the vehicle interior is exposed to moisture and becomes soaked up to the level of the sensing and diagnostic module (SDM), the SDM and SDM harness connector must be replaced. The SDM could be activated when powered, which could cause airbag deployment and result in personal injury.

Depending on the location of the waterleak, you may have to remove certain interior components in order to repair the leak.

1. If the floor carpet is wet refer to [Floor Carpet Drying](#) .

Fig. 7: Cutting Out Adhesive Caulking (2 Of 2)

Courtesy of GENERAL MOTORS COMPANY

2. Cut out a portion of the adhesive caulking in the leak area from inside or outside of the vehicle.
3. Clean and remove all loose particles of the adhesive old caulking from the area.
4. Apply joint body and seam sealer where the old adhesive caulking was removed.
5. Allow the adhesive caulking to dry for several hours.
6. Test for leaks.
7. Install the trim, if removed.

STATIONARY WINDOW WATERLEAK REPAIR

WARNING: If any water enters the vehicle interior up to the level of the carpet or higher and soaks the carpet, the sensing and diagnostic module (SDM) and the SDM harness connector may need to be replaced. The SDM could be activated when powered, which could cause deployment of the air bag(s) and result in personal injury. Before attempting these procedures, the SIR system must be disabled. Refer to Disabling the SIR System.

With the ignition OFF, inspect the SDM mounting area, including the carpet. If any significant soaking or evidence of significant soaking is detected, you must perform the following tasks:

- 1. Remove all water.**
- 2. Repair the water damage.**
- 3. Replace the SDM harness connector.**
- 4. Replace the SDM.**

Failure to follow these tasks could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

1. If the floor carpet is wet refer to [**Floor Carpet Drying**](#) .
 2. Remove the trim moldings or the headliner in order to repair the leak, if needed.
 3. Determine the source of water entry.
 4. If water is leaking at the edge of the windshield, reseal the windshield using Urethane Adhesive Systems which meet GM Specification GM 3651G.
 5. If water leaks into the vehicle at the sides of the stationary windows, reseal the window using Urethane Adhesive Systems which meet GM Specification GM 3651G.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B2745: TRACTION CONTROL SWITCH CIRCUIT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC B2745

Traction Control Switch Circuit

For symptom byte information refer to [Symptom Byte List](#)

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Traction Control Switch Signal	B2745 02	1	1	-

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Traction Control Switch Ground	-	1	-	-
1. Traction Control Switch Malfunction.				

Circuit/System Description

The body control module monitors the electronic stability control switch. When the electronic stability control switch is pressed once, the body control module will request the electronic brake control module via serial data to disable the traction control. When the electronic stability control switch is pressed and held for five seconds, the body control module will request the electronic brake control module to disable the stability control. The Electronic Brake Control Module will request the Instrument Cluster to turn the Traction Control Off and Stability Control Off indicator ON to notify the driver of the deactivation.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

The body control module detects a short to ground on the signal circuit.

Action Taken When the DTC Sets

The body control module ignores the traction control switch signal input.

Conditions for Clearing the DTC

- When the condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the Instrument Cluster indicators listed below turn ON and OFF when commanding the All Indicators ON and OFF with a scan tool.
 - Traction Control Off indicator
 - Stability Control Off indicator
 - Traction/stability Control indicator
 - **If any indicator does not turn ON and OFF**

Replace the P16 Instrument Cluster.
 - **If all indicators turn ON and OFF**
3. Verify the scan tool Body Control Module, Traction Control Switch parameter changes between Active and Inactive while pressing and releasing the S48E Multifunction Switch-Instrument Panel.
 - **If the parameter does not change**

Refer to Circuit/System Testing.
 - **If the parameter changes**
4. All OK.

Circuit/System Testing

NOTE: **Circuit/System Verification must be performed before Circuit/System Testing.**

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S48E Multifunction Switch-Instrument Panel. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
 - **If 10 Ω or greater**
 1. Ignition OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
3. Ignition ON.
4. Verify the scan tool Body Control Module, Traction Control Switch parameter is Inactive.
 - **If Active**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal 14 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the K9 Body Control Module.

- **If Inactive**

5. Install a 3 A fused jumper wire between the signal circuit terminal 4 and ground.

6. Verify the scan tool Traction Control Switch parameter is Active.

- **If Inactive**

1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module, ignition ON.

2. Test for less than 1 V between the signal circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V.

3. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K9 Body Control Module.

- **If Active**

7. Test or replace the S48E Multifunction Switch-Instrument Panel.

Component Testing

1. Ignition OFF, disconnect the harness connector at the S48E Multifunction Switch-Instrument Panel.

2. Test for infinite resistance between the signal terminal 4 and the ground terminal 1 with the switch in the open position.

- **If less than infinite resistance**

Replace the S48E Multifunction Switch-Instrument Panel.

- **If infinite resistance**

3. Test for less than 2 Ω between the signal circuit terminal 4 and the ground terminal 1 with the switch in the closed position.

- **If 2 Ω or greater**

Replace the S48E Multifunction Switch-Instrument Panel.

- **If less than 2 Ω**

4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Vehicle Stability Control System Switch Replacement**
- **Control Module References** for Body Control Module or Instrument Cluster replacement, programming and setup.

DTC C0010-C0019, C001C, OR C001D: INLET CONTROL/OUTLET CONTROL

Diagnostic Instructions

- Perform the prior to [Diagnostic System Check - Vehicle](#) using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC C0010

DTC C001D

Right Rear Outlet Control

Circuit/System Description

The solenoid valves are integral parts of the brake pressure modulator valve assembly. The brake pressure modulator valve assembly contains an inlet solenoid valve and an outlet solenoid valve for each wheel. The solenoid valves are not engaged during normal system operation. When the ABS, electronic brake force distribution or traction control/stability control operation is required the electronic brake control module turns the required solenoid valves ON.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

The electronic brake control module detects a short to ground or open/high resistance on the internal control circuit.

Action Taken When the DTC Sets

- The electronic brake control module disables the ABS, the electronic brake force distribution and the traction control/stability control for the duration of the ignition cycle.
- The ABS warning indicator turns ON.
- The traction control/stability control-active indicator turns ON.
- The brake force distribution indicator turns ON.

Conditions for Clearing the DTC

- A current DTC clears when the diagnostic runs and passes.
- The electronic brake control module will turn OFF the indicators and enable the system functions in the next ignition cycle.

Circuit/System Testing

1. Ignition ON/Vehicle in Service mode.
2. Verify that DTC C0010, C0011, C0014, C0015, C0018, C0019, C001C or C001D are not set while operating the vehicle under normal driving conditions.
 - If any of the DTCs are set

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the K17 Electronic Brake Control Module. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminals listed below and ground:
 - Terminal 14
 - Terminal 46
 - **If 10 Ω or greater**

Repair the open/high resistance in the circuit.

- **If less than 10 Ω**

3. Replace the Q5 Brake Pressure Modulator

- **If none of the DTCs are set**

3. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

[Control Module References](#) for electronic brake control module replacement, programming and setup.

DTC C0051: STEERING WHEEL ANGLE SENSOR

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC C0051

Steering Wheel Angle Sensor

For symptom byte information refer to [Symptom Byte List](#)

Circuit/System Description

The steering wheel angle sensor is integrated into the steering gear assembly. The steering wheel angle sensor identifies the position and direction of the steering wheel rotation.

The electronic brake control module receives high speed serial data inputs from the steering angle sensor identifying the position and direction of the steering wheel rotation. The electronic brake control module utilizes this signal to calculate the driver intended driving direction.

Conditions for Running the DTC

Vehicle ON or Vehicle in Service Mode.

Conditions for Setting the DTC

C0051 66

The steering wheel angle sensor signal rate of change is too fast greater than 30°/s.

C0051 4B

The steering wheel angle sensor signal is found to not be calibrated.

C0051 1A

The steering wheel angle sensor signal is above the maximum specification.

Action Taken When the DTC Sets

- The traction/stability control indicator turns ON.
- A Service Stabile Trak message may be displayed on the driver information center.
- A Service Brake Assist message may be displayed on the driver information center.
- A Service Power Steering Drive with Care message may be displayed on the driver information center.
- The electronic brake control module disables the traction control and the electronic stability control for the duration of the ignition cycle.

Conditions for Clearing the DTC

- A current DTC clears when the diagnostic runs and passes.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Diagnostic Aids

- Check and adjust all tires to the stated cold air pressure as identified on the tire placard.
- The car should not pull in either direction causing the steering wheel to be off center while driving in a straight line on a level surface.
- Confirm that all tires are of the proper size and matching brands. If a mis-sized or non-matching brand tire is present, inform the customer that in order for the vehicle stability enhanced system to function normally, tires need to be a uniform size and rolling diameter.
- Inspect the serial data circuits and connections at the power steering control module and the electronic brake control module. They should be free from sources of electromagnetic interference and the connections should be clean and tight.

DTC C006B: STABILITY SYSTEM ACTIVE TOO LONG

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC C006B

Stability System Active Too Long

Circuit/System Description

The electronic brake control module activates the stability system depending on steering angle and multi-axis acceleration sensor input. When the traction control or stability control operation is required the EBCM turns the required solenoid valves ON.

The electronic brake control module receives high speed serial data inputs from the steering angle sensor and multi-axis sensor, that identify the position and direction of the steering wheel rotation as well as vehicle yaw and lateral movement. The electronic brake control module utilizes these signal to calculate the driver intended driving direction.

The steering wheel angle sensor is integrated into the steering gear assembly. The multi-axis sensor is located internally into the inflatable restraint and sensing diagnostic module.

Conditions for Running the DTC

- Ignition ON
- Stability control is active.

Conditions for Setting the DTC

Stability control is active for more than 15 s.

Action Taken When the DTC Sets

- The EBCM disables the traction control and stability control for the duration of the ignition cycle.
- The traction control/stability control-active indicator turns ON.

Conditions for Clearing the DTC

- A current DTC clears when the diagnostic runs and passes.
- The EBCM will turn OFF the indicators and enable the system functions in the next ignition cycle.

Diagnostic Aids

Inspect the serial data circuits and connections at the power steering control module and the electronic brake control module. They should be free from sources of electromagnetic interference and the connections should be clean and tight.

Circuit/System Verification

1. Vehicle in Service Mode.
2. With a scan tool check the Power Steering Control Module for any DTCs.
 - **If any DTCs are present in the Power Steering Control Module**

Refer to Diagnostic Trouble Code (DTC) List - Vehicle in Power Steering Diagnostic Information and Procedures.

3. Verify that the steering gear assembly is not incorrectly installed.
 - **If the steering gear assembly is installed incorrectly**

Refer to [Electric Belt Drive Rack and Pinion Steering Gear Replacement](#)

- If the steering gear assembly is installed correctly

4. Perform the [Steering Wheel Angle Sensor Centering](#) procedure.

- If the Steering Angle Sensor Centering procedure corrected the DTC

Proceed to step 7

- If the Steering Angle Sensor Centering procedure did not correct the DTC

5. Verify that the inflatable restraint and sensing diagnostic module is installed correctly.

- If inflatable restraint and sensing diagnostic module is not installed correctly

Refer to [Airbag Sensing and Diagnostic Module Replacement](#)

- If inflatable restraint and sensing diagnostic module is installed correctly

6. Replace the K17 Electronic Brake Control Module.

7. All OK

Ignition	U0125, U0126, C0186 71, C0196 71, C0287 71	U0125, U0126, C0186 71, C0196 71, C0287 71	-	C0186 5A, C0196 5A
Ground	-	U0125, U0126, C0186 71, C0196 71, C0287 71	-	C0186 5A, C0196 5A

Circuit/System Description

The yaw rate, lateral acceleration and longitudinal acceleration sensors are combined into one multi-axis acceleration sensor, external to the electronic brake control module. The electronic brake control module supplies ignition voltage to the multi-axis acceleration sensor. The multi-axis acceleration sensor communicates with the electronic brake control module via serial data. The electronic brake control module activates the ABS, the traction control and the stability control depending on the multi-axis acceleration sensor input.

Conditions for Running the DTC

- Ignition ON begins the initialization of the brake system power-up self test.
- Drive the vehicle at speeds greater than 16 km/h (10 MPH) to complete the active brake system test.

Conditions for Setting the DTC

C0186 00 or C018B 5A

The lateral acceleration signal is out of the specified range.

C0186 5A

The lateral acceleration signal is not plausible with the yaw rate signal, steering angle signal and vehicle speed.

C0186 71

- The electronic brake control module received an invalid lateral acceleration signal.
- An open/high resistance is detected on the multi-axis acceleration ground circuit.

- A short to ground or open/high resistance is detected on the multi-axis acceleration ignition circuit.

C0196 00 or C019B 5A

The yaw rate signal is out of the specified range.

C0196 5A

- The yaw rate signal offset is out of the specified range.
- The yaw rate signal is not plausible with the lateral acceleration signal, the steering angle signal and the vehicle speed.

C0196 71

- A short to ground or open/high resistance is detected on the ignition circuit.
- The electronic brake control module received an invalid lateral acceleration signal.
- An open/high resistance is detected on the multi-axis acceleration ground circuit.

C027E 5A

The longitudinal acceleration signal is not plausible.

C0287 4B

The longitudinal acceleration sensor is not calibrated.

C0287 5A

The longitudinal acceleration signal is not plausible with the vehicle speed.

C0287 71

- An open/high resistance is detected on the multi-axis acceleration ground circuit.
- The electronic brake control module received an invalid longitudinal acceleration signal.
- A short to ground or open/high resistance is detected on the multi-axis acceleration ignition circuit.

Action Taken When the DTC Sets

- The adaptive cruise control is inhibited.
- The traction control Off indicator turns ON.
- The traction/stability control indicator turns ON.
- A Traction Control Off message may be displayed.
- A Service Stabilitrak message may be displayed.
- The electronic brake control module disables the traction control and stability control for the duration of the ignition cycle.

Conditions for Clearing the DTC

- The DTC clears when the diagnostic runs and passes.

- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Circuit/System Testing

1. Ignition ON.
2. Verify DTC C0186 5A, C018B 5A, C0196 5A, C019B 5A, C027E 5A, C0287 4B, or C0287 5A is not set.
 - **If any of the DTCs are set**
 1. Perform the **Vehicle Yaw Sensor Learn (with UGN)****Vehicle Yaw Sensor Learn (without UGN)** procedures to complete the learn.
 2. Verify the DTC does not set while operating the vehicle within the Conditions for Running the DTC.
 - If the DTC sets, replace the K17 Electronic Brake Control Module.
 - If the DTC does not set
3. All OK.
 - **If none of the DTCs are set**
3. Verify the B119 Multi-axis Acceleration Sensor is installed correctly.
 - **If loose or incorrect installation**
Correct the installation of the component.
 - **If installed correctly**
4. Ignition OFF, all vehicle system OFF, and the scan tool disconnected, disconnect the harness connector at

the B119 Multi-axis Acceleration Sensor. It may take up to 2 minutes for all vehicle systems to power down.

5. Test for less than 10 Ω between the ground circuit terminal 6 and ground.

- **If 10 Ω or greater**

1. Ignition OFF.

2. Test for less 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 10 Ω**

6. Ignition ON.

7. Verify a test lamp illuminates between the ignition circuit terminal 5 and ground.

- **If the test lamp does not illuminate**

1. Ignition OFF, disconnect the harness connector at the K17 Electronic Brake Control Module.

2. Test for infinite resistance between the ignition circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the ignition circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K17 Electronic Brake Control Module.

- **If the test lamp illuminates**

8. Replace the B119 Multi-axis Acceleration Sensor.

9. Verify the DTC does not set while operating the vehicle within the Conditions for Running the DTC.

- **If the DTC sets**

Replace the K17 Electronic Brake Control Module.

- **If the DTC does not set**

10. All OK.

Circuit/System Description

The wheel speeds are detected by active wheel speed sensors and encoder rings. The encoder rings consist of permanent magnets located in the hub. As the wheel spins the magnetic encoder ring rotates and passes by the wheel speed sensor head; which generates a sign wave in the wheel speed sensor. Each wheel speed sensor receives ignition voltage from the electronic brake control module and provides an alternating current square wave signal to the electronic brake control module. The electronic brake control module uses the frequency of the signals to calculate the wheel speeds.

Conditions for Running the DTC

- Vehicle On or Vehicle in Service Mode
- Ignition voltage is greater than 10 V.

Conditions for Setting the DTC

C0500, C0502, C0503, C0506, C0508, C0509, C050C, C050E, C050F, C0512, C0514, C0515

- An open or a high resistance is detected on a wheel speed sensor circuit.
- A short to ground or an open/high resistance is detected on a wheel speed sensor signal circuit.
- A short to voltage is detected on a wheel speed sensor signal circuit.

C0501, C0504, C0507, C050A, C050D, C0510, C0513, C0516

- The tone ring may be demagnetized
- Water intrusion in the wiring harness
- Incorrectly mounted wheel speed sensor
- Debris on the wheel speed sensor or the tone ring
- Missing tooth or teeth on the wheel speed sensor tone ring
- Air gap between the wheel speed sensor and the tone ring too large
- Electrical magnetic interference with the wheel speed sensor harness

Actions Taken when the DTC Sets

- The ABS indicator turns ON.
- The traction/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information center.
- The electronic brake control module disables the ABS, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Diagnostic Aids

- Do not use a magnet to clean the wheel speed sensor magnetic encoder ring.

- Inspect the wheel speed sensor magnetic encoder ring for debris or corrosion.
- If two or more wheel speed sensors are inoperative, diagnose each wheel speed sensor individually.
- If the customer comments that the ABS indicator is ON only during moist environmental conditions (rain, snow, vehicle wash, etc.), inspect the wheel speed sensor wiring for signs of water intrusion.

Circuit/System Verification

1. Test drive the vehicle in a straight line at a speed greater than 20 km/h (13 MPH).
2. Verify all scan tool Wheel Speed Sensor parameters are within 1.6 km/h (1 MPH) of each other.
 - **If any parameter is not within 1.6 km/h (1 MPH) of each other**

Refer to Circuit/System Testing.

- **If each parameter is within 1.6 km/h (1 MPH) of each other**
3. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connectors at the appropriate B5 Wheel Speed Sensor and the harness connector at the K17 Electronic Brake Control Module, vehicle in service mode.
2. Test for less than 1 V between the appropriate K17 Electronic Brake Control Module harness connector terminals listed below and ground:
 - B5LF Wheel Speed Sensor - Left Front - terminal 24 and terminal 7

- B5LR Wheel Speed Sensor - Left Rear - terminal 39 and terminal 23
- B5RF Wheel Speed Sensor - Right Front - terminal 21 and terminal 26
- B5RR Wheel Speed Sensor - Right Rear - terminal 22 and terminal 37
- **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

3. Vehicle OFF.

4. Test for infinite resistance between the K17 Electronic Brake Control Module harness connector terminals listed below and ground:

- B5LF Wheel Speed Sensor - Left Front - terminal 24 and terminal 7
- B5LR Wheel Speed Sensor - Left Rear - terminal 39 and terminal 23
- B5RF Wheel Speed Sensor - Right Front - terminal 21 and terminal 26
- B5RR Wheel Speed Sensor - Right Rear - terminal 22 and terminal 37
- **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

5. Test for less than 2 Ω between the B5 Wheel Speed Sensor harness connector terminal 1 and the K17 Electronic Brake Control Module harness connector terminal listed below:

- B5LF Wheel Speed Sensor - Left Front - terminal 24
- B5LR Wheel Speed Sensor - Left Rear - terminal 39
- B5RF Wheel Speed Sensor - Right Front - terminal 21
- B5RR Wheel Speed Sensor - Right Rear - terminal 22
- **If 2 Ω or greater**

Repair the open/high resistance in the circuit.

- **If less than 2 Ω**

6. Test for less than 2 Ω between the B5 Wheel Speed Sensor harness connector terminal 2 and the K17 Electronic Brake Control Module harness connector terminal listed below:

- B5LF Wheel Speed Sensor - Left Front - terminal 7
- B5LR Wheel Speed Sensor - Left Rear - terminal 23
- B5RF Wheel Speed Sensor - Right Front - terminal 26
- B5RR Wheel Speed Sensor - Right Rear - terminal 37
- **If 2 Ω or greater**

Repair the open/high resistance in the circuit.

- **If less than 2 Ω**

7. Replace the B5 Wheel Speed Sensor.

8. Verify the DTC does not set while operating the vehicle within the Conditions for Running the DTC.

- **If the DTC sets**

Replace the K17 Electronic Brake Control Module.

- **If the DTC does not set**

9. All OK.

DTC Descriptors

DTC C059B

Right Front Brake Pressure Sensor Missing Calibration

DTC C0560

Left Front Brake Pressure Sensor Missing Calibration

Circuit/System Description

The brake pressure sensors located in the brake pressure modulator send testpulses to determine if they are calibration with each other.

Conditions for Running the DTC

- Vehicle ON or Vehicle in Service Mode.

Conditions for Setting the DTC

This diagnostic detects that the brake pressure module testpulses differ from the nominal value by more than 10%.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The red brake indicator turns ON.
- The traction/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information

center.

- The electronic brake control module disables the ABS, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

DTC C0571, C0572, OR C0574: BRAKE MASTER CYLINDER PRESSURE SENSOR 1 CIRCUIT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC C0571

Brake Master Cylinder Pressure Sensor 1 Circuit Low Voltage

DTC C0572

Brake Master Cylinder Pressure Sensor 1 Circuit High Voltage

DTC C0574

Brake Master Cylinder Pressure Sensor 1 Circuit Performance

Circuit/System Description

The electronic brake control module uses input from the master cylinder pressure sensor for more accurate control during a vehicle stability enhancement system event. The master cylinder pressure sensor is internal to the brake pressure modulator.

Conditions for Running the DTC

- The brake pedal is not applied.
- Ignition voltage is greater than 10 V.
- Vehicle ON or Vehicle in Service Mode.

Conditions for Setting the DTC

C0571

A short to ground or open is detected on the sensor signal circuit.

C0572

A short to battery is detected on the sensor signal circuit.

C0574

The master cylinder pressure sensor raw offset is out of specified range.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The red brake indicator turns ON.
- The traction/stability control indicator turns ON.

- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information center.
- The electronic brake control module disables the ABS, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC C0575

Left Rear Brake Pressure Sensor Circuit Low Voltage

DTC C0576

Left Rear Brake Pressure Sensor Circuit High Voltage

DTC C0578

Left Rear Brake Pressure Sensor Circuit Performance

Circuit/System Description

The Electronic Brake Control Module detects an issue with the Left Rear Brake Pressure Sensor which is located internally in the Brake Pressure Modulator Valve.

Conditions for Running the DTC

- Vehicle ON or Vehicle in Service Mode.

Conditions for Setting the DTC

C0575

The Electronic Brake Control Module detects the Left Rear Brake Pressure Sensor is shorted to ground.

C0576

The Electronic Brake Control Module detects the Left Rear Brake Pressure Sensor is shorted to voltage.

C0578

The Electronic Brake Control Module detects the Left Rear Brake Pressure Sensor is out of the specified value.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The red brake indicator turns ON.
- The traction/stability control indicator turns ON.

- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information center.
- The electronic brake control module disables the ABS, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Wheel Speed Sensor Frequency

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Left Front Wheel Speed Sensor Ignition	C0502, C05A4	C0500, C05A3	-	C0501, C0504, C10EE
Left Front Wheel Speed Sensor Signal	C0502	C0500	C0503	C0501, C0504, C10EE
Right Front Wheel Speed Sensor Ignition	C0508, C05A4	C0506, C05A3	-	C0507, C050A, C10EE
Right Front Wheel Speed Sensor Signal	C0508	C0506	C0509	C0507, C050A, C10EE
Left Rear Wheel Speed Sensor Ignition	C050E, C05A4	C050C, C05A3	-	C050D, C0510, C10EE
Left Rear Wheel Speed Sensor Signal	C050E	C050C	C050F	C050D, C0510, C10EE
Right Rear Wheel Speed Sensor Ignition	C0514, C05A4	C0512, C05A3	-	C0513, C0516, C10EE
Right Rear Wheel Speed Sensor Signal	C0514	C0512	C0515	C0513, C0516, C10EE

Circuit/System Description

The wheel speeds are detected by active wheel speed sensors and encoder rings. The encoder rings consist of

permanent magnets located in the hub. As the wheel spins the magnetic encoder ring rotates and passes by the wheel speed sensor head; which generates a sign wave in the wheel speed sensor. Each wheel speed sensor receives ignition voltage from the electronic brake control module and provides an alternating current square wave signal to the electronic brake control module. The electronic brake control module uses the frequency of the signals to calculate the wheel speeds.

Conditions for Running the DTC

- Vehicle On or Vehicle in Service Mode
- Ignition voltage is greater than 10 V.

Conditions for Setting the DTC

C05A3, C05A4

- An open or a high resistance is detected on a wheel speed sensor circuit.
- A short to ground or an open/high resistance is detected on a wheel speed sensor signal circuit.
- A short to voltage is detected on a wheel speed sensor signal circuit.

C10EE

- The tone ring may be demagnetized
- Water intrusion in the wiring harness
- Incorrectly mounted wheel speed sensor
- Debris on the wheel speed sensor or the tone ring
- Missing tooth or teeth on the wheel speed sensor tone ring
- Air gap between the wheel speed sensor and the tone ring too large
- Electrical magnetic interference with the wheel speed sensor harness

Actions Taken when the DTC Sets

- The ABS indicator turns ON.
- The traction/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information center.
- The electronic brake control module disables the ABS, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Diagnostic Aids

- Do not use a magnet to clean the wheel speed sensor magnetic encoder ring.
- Inspect the wheel speed sensor magnetic encoder ring for debris or corrosion.

- If two or more wheel speed sensors are inoperative, diagnose each wheel speed sensor individually.
- If the customer comments that the ABS indicator is ON only during moist environmental conditions (rain, snow, vehicle wash, etc.), inspect the wheel speed sensor wiring for signs of water intrusion.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Test drive the vehicle in a straight line at a speed greater than 20 km/h (13 MPH).
2. Verify all scan tool Wheel Speed Sensor parameters are within 1.6 km/h (1 MPH) of each other.
 - **If any parameter is not within 1.6 km/h (1 MPH) of each other**

Refer to Circuit/System Testing.

- **If each parameter is within 1.6 km/h (1 MPH) of each other**
3. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connectors at the appropriate B5 Wheel Speed Sensor and the harness connector at the K17 Electronic Brake Control Module, vehicle in service mode.
2. Test for less than 1 V between the appropriate K17 Electronic Brake Control Module harness connector terminals listed below and ground:
 - B5LF Wheel Speed Sensor - Left Front - terminal 24 and terminal 7
 - B5LR Wheel Speed Sensor - Left Rear - terminal 39 and terminal 23

- B5RF Wheel Speed Sensor - Right Front - terminal 21 and terminal 26
- B5RR Wheel Speed Sensor - Right Rear - terminal 22 and terminal 37
- **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

3. Vehicle OFF.

4. Test for infinite resistance between the K17 Electronic Brake Control Module harness connector terminals listed below and ground:

- B5LF Wheel Speed Sensor - Left Front - terminal 24 and terminal 7
- B5LR Wheel Speed Sensor - Left Rear - terminal 39 and terminal 23
- B5RF Wheel Speed Sensor - Right Front - terminal 21 and terminal 26
- B5RR Wheel Speed Sensor - Right Rear - terminal 22 and terminal 37
- **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

5. Test for less than 2 Ω between the B5 Wheel Speed Sensor harness connector terminal 1 and the K17 Electronic Brake Control Module harness connector terminal listed below:

- B5LF Wheel Speed Sensor - Left Front - terminal 24
- B5LR Wheel Speed Sensor - Left Rear - terminal 39
- B5RF Wheel Speed Sensor - Right Front - terminal 21
- B5RR Wheel Speed Sensor - Right Rear - terminal 22
- **If 2 Ω or greater**

Repair the open/high resistance in the circuit.

- **If less than 2 Ω**

6. Test for less than 2 Ω between the B5 Wheel Speed Sensor harness connector terminal 2 and the K17 Electronic Brake Control Module harness connector terminal listed below:

- B5LF Wheel Speed Sensor - Left Front - terminal 7
- B5LR Wheel Speed Sensor - Left Rear - terminal 23
- B5RF Wheel Speed Sensor - Right Front - terminal 26
- B5RR Wheel Speed Sensor - Right Rear - terminal 37
- **If 2 Ω or greater**

Repair the open/high resistance in the circuit.

- **If less than 2 Ω**

7. Replace the B5 Wheel Speed Sensor.

8. Verify the DTC does not set while operating the vehicle within the Conditions for Running the DTC.

- **If the DTC sets**

Replace the K17 Electronic Brake Control Module.

- **If the DTC does not set**

9. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC C05AD: BRAKE BLENDING SYSTEM PERFORMANCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC C05AD

Brake Blending System Performance

Circuit/System Description

The electronic brake control module uses input from the master cylinder pressure sensor for more accurate control during a vehicle stability enhancement system event. The master cylinder pressure sensor is internal to the brake pressure modulator.

Conditions for Running the DTC

- The brake pedal is not applied.
- Ignition voltage is greater than 10 V.
- Vehicle ON or Vehicle in Service Mode.

Conditions for Setting the DTC

An anomaly in brake pressure in the master cylinder or hydraulic lines has been detected.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The traction/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information

center.

- The electronic brake control module disables the ABS, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Diagnostic Aids

The diagnostic for DTC C05AD will have you test and inspect the base hydraulic brake system for any issues. The hydraulic brake system must be thoroughly inspected for any bent or kinked brake lines, both metal and rubber. Also the vehicles brake calipers must also be able to slide and apply freely.

DTC C05B2: STEERING WHEEL ANGLE SENSOR SIGNAL - YAW RATE SENSOR SIGNAL NOT PLAUSIBLE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC C05B2

Steering Wheel Angle Sensor Signal - Yaw Rate Sensor Signal Not Plausible

Circuit/System Description

The electronic brake control module receives high speed serial data inputs from the steering angle sensor and multi-axis sensor, that identify the position and direction of the steering wheel rotation as well as vehicle yaw and lateral movement. The electronic brake control module utilizes these signal to calculate the driver intended driving direction.

The steering wheel angle sensor is integrated into the steering gear assembly. The multi-axis sensor is located internally into the inflatable restraint and sensing diagnostic module.

Conditions for Running the DTC

Vehicle ON or Vehicle in Service Mode.

Conditions for Setting the DTC

The difference between model yaw rate out of steering angle, model yaw rate out of wheel speeds and measured yaw rate has to be less than 2 deg/s during straight ahead driving and cornering.

Action Taken When the DTC Sets

- The traction/stability control indicator turns ON.
- A Service StabiliTrak message may displayed on the driver information center.
- The electronic brake control module disables the traction control and the electronic stability control for the duration of the ignition cycle.

Conditions for Clearing the DTC

- A current DTC clears when the diagnostic runs and passes.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Circuit/System Description

Battery positive voltage is supplied to the electronic brake control module at all times through a 60 A fuse located in the underhood fuse block. The electronic brake control module uses this voltage to power the pump motor. The pump motor is an integral part of the brake pressure modulator, while the pump motor relay is

integral to the electronic brake control module. The pump motor relay is not engaged during normal system operation. When the ABS or the action control system operation is required the electronic brake control module activates the pump motor relay and turns the pump motor ON.

Conditions for Running the DTC

- Vehicle ON or Vehicle in Service Mode.
- The ignition voltage is greater than 10 V.

Conditions for Setting the DTC

C106A

The electronic brake control module detects the ABS pump motor relay circuit is shorted to ground.

C106B

The electronic brake control module detects the ABS pump motor relay circuit is shorted to voltage.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The red brake indicator turns ON.
- The traction/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information center.
- The electronic brake control module disables the ABS, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

6. Verify that a test lamp illuminates between the ignition circuit terminal 17 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**

1. Vehicle OFF.
2. Test for less than 2 Ω in the ignition circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance or the short to ground in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
- **If the test lamp illuminates**
7. Replace the K17 Electronic Brake Control Module.

DTC C10AC: BRAKE SYSTEM CALCULATED COMPONENT OVERHEAT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC C10AC 00

Brake System Calculated Component Overheat

Circuit/System Description

The electronic brake control module monitors how often the traction control or the stability control system activates in order to calculate an estimate of the front brake discs temperature. In most cases the high temperatures are caused by extended traction control activation. If the electronic brake control module calculates that the front brake components temperatures are too high, the electronic brake control module will temporarily suspend the traction control system function until the front brake discs cool down.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

The electronic brake control module detects the calculated temperature of the brake components is higher than 500 $\hat{\text{A}}$ $^{\circ}\text{C}$ (932 $\hat{\text{A}}$ $^{\circ}\text{F}$).

Action Taken When the DTC Sets

- The traction/stability control indicator turns ON.
- The electronic brake control module disables the ABS, the traction control, the stability control and the electronic brake distribution for the duration of the ignition cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Diagnostic Aids

DTC C10AC does not indicate a malfunction has occurred. This DTC indicates there was excessive ABS, traction control or stability control activation that caused the high temperatures.

Circuit/System Verification

NOTE: Since most occurrences of this DTC are caused by excessive brake usage, review with the customer the conditions under which the DTC set.

1. Allow the brakes to cool down before performing test.

2. Verify that no other DTCs are set.

- If any other DTCs are set

Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

- If no other DTCs are set

3. Verify DTC C10AC does not set while driving the vehicle under normal braking conditions.

- If the DTC sets

Replace the K17 Electronic Brake Control Module.

- **If the DTC does not set**

4. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

[Control Module References](#) for Electronic Brake Control Module replacement, programming, and setup

DTC C10EA: POWERTRAIN CONTROL MODULE INDICATED REQUESTED TORQUE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC C10EA

Powertrain Control Module Indicated Requested Torque

Circuit/System Description

The electronic brake control module and the engine control module simultaneously control the regenerative braking. When certain engine control module DTCs are set, the engine control module will not be able to perform the regenerative braking. A serial data message is sent to the electronic brake control module indicating that regenerative braking is not allowed.

Conditions for Running the DTC

- Vehicle in Service Mode.
- The ignition voltage is greater than 10 V.

Conditions for Setting the DTC

The engine control module diagnoses a condition preventing the engine control portion of the regenerative braking function and sends a serial data message to the electronic brake control module indicating that regenerative braking is not allowed.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The MIL indicator may be on or flashing.
- The traction control/stability control indicator turns ON.
- The Service StabiliTrak message is displayed on the driver information center.
- The electronic brake control module disables the ABS, the traction control system and the electronic

stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC C10EB

Engine Control Module Indicated Traction Control

Circuit/System Description

The electronic brake control module and the engine control module simultaneously control the traction control. The electronic brake control module sends a serial data message to the engine control module requesting torque reduction. When certain engine control module DTCs are set, the engine control module will not be able to perform the torque reduction for traction control. A serial data message is sent to the electronic brake control module indicating that traction control is not allowed.

Conditions for Running the DTC

- Vehicle in Service Mode.
- The ignition voltage is greater than 10 V.

Conditions for Setting the DTC

The engine control module diagnoses a condition preventing the engine control portion of the traction control function and sends a serial data message to the electronic brake control module indicating that torque reduction is not allowed.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The MIL indicator may be on or flashing.
- The traction control/stability control indicator turns ON.
- The Service StabiliTrak message is displayed on the driver information center.
- The electronic brake control module disables the ABS, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC C112B

Active Brake System Performance

Circuit/System Description

The Electronic Brake Control Module detects that there has been no pressure increase for a period of time.

Conditions for Running the DTC

- Vehicle ON or Vehicle in Service Mode.

Conditions for Setting the DTC

The Electronic Brake Control Module detects that there has been no pressure increase for a period of time.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The red brake indicator turns ON.
- The traction/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information center.
- The electronic brake control module disables the ABS, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- Accelerating to 60 KPH and maintaining this speed for 5 s with no pressure increase noted by the electronic brake control module.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

DTC C112F: ISOLATION VALVE PERFORMANCE

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC C112F

Isolation Valve Performance

Circuit/System Description

The electronic brake control module calculates and monitors the internal temperature of the brake pressure modulator valves. In most cases the high temperatures are caused by extended traction control activation. If the electronic brake control module calculates that the brake pressure modulator valves temperatures are too high, the electronic brake control module will temporarily suspend the traction control system function until the brake pressure modulator valves cool down.

Conditions for Running the DTC

Vehicle ON or in Service Mode.

Conditions for Setting the DTC

The electronic brake control module detects the calculated temperature of the brake pressure modulator valves is higher than 195°C (383°F).

Action Taken When the DTC Sets

- The traction/stability control indicator turns ON.
- The electronic brake control module disables the ABS, the traction control, the stability control and the electronic brake distribution for the duration of the ignition cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Diagnostic Aids

DTC C112F does not indicate a malfunction has occurred. This DTC indicates there was excessive ABS, traction control or stability control activation that caused the high temperatures.

DTC C1200: POWERTRAIN SENSED BRAKE PEDAL INFORMATION MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC C1200

Powertrain Sensed Brake Pedal Information Message Counter Incorrect

Circuit/System Description

The body control module monitors the brake pedal position sensor and sends a serial data message to the both the electronic brake control module and engine control modules when the brake pedal is applied. The engine control module compares the correlation between the brake pedal positions and the brake control brake pedal position sensor to sense the driver's application of the brake pedal.

Conditions for Running the DTC

- Vehicle ON
- The brake pedal is applied.
- The ignition voltage is greater than 10 V.
- The accelerator pedal position is greater than 20 %.

Conditions for Setting the DTC

The brake pedal position sensor signal is not applied while the brake control brake pedal position sensor indicates the brake pedal is applied.

Action Taken When the DTC Sets

A driver information center message and/or a warning indicator will not be displayed.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Diagnostic Aids

- DTC C1200 may set if the brake pedal is applied while accelerating.
- Check the Engine Control Module for any accelerator pedal DTCs and correct them first before diagnosing this DTC.

DTC C124C-C124E OR C1269: WHEEL SPEED SENSOR INCORRECT MOUNTING

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.

[Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC C124C

Left Front Wheel Speed Sensor Incorrect Mounting

DTC C124D

Right Front Wheel Speed Sensor Incorrect Mounting

DTC C124E

Left Rear Wheel Speed Sensor Incorrect Mounting

DTC C1269

Right Rear Wheel Speed Sensor Incorrect Mounting

Diagnostic Fault Information

Component	Condition	DTC
Wheel Speed Sensor	• Loose or improperly mounted sensor	C0555, C0556,

Component	Condition	DTC
	- Physical damage - Debris on the wheel speed sensor or the encoder ring - Loose or worn wheel bearing - Air gap between the wheel speed sensor and the encoder ring too large - Water intrusion in the wiring harness	C0557, C0558

Circuit/System Description

The wheel speeds are detected by active wheel speed sensors and encoder rings. The encoder rings consist of permanent magnets located in the hub. As the wheel spins the magnetic encoder ring rotates and passes by the wheel speed sensor head; which generates a sign wave in the wheel speed sensor. Each wheel speed sensor receives ignition voltage from the electronic brake control module and provides an alternating current square wave signal to the electronic brake control module. The electronic brake control module uses the frequency of the signals to calculate the wheel speeds.

Conditions for Running the DTC

- Vehicle On or Vehicle in Service Mode
- Ignition voltage is greater than 10 V.

Conditions for Setting the DTC

C124C, C124D, C124E, C1269

- Loose or improperly mounted sensor
- The tone ring may be demagnetized
- Water intrusion in the wiring harness
- Debris on the wheel speed sensor or the tone ring
- Missing tooth or teeth on the wheel speed sensor tone ring
- Air gap between the wheel speed sensor and the tone ring too large
- Electrical magnetic interference with the wheel speed sensor harness

Actions Taken when the DTC Sets

- The ABS indicator turns ON.
- The traction/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information center.
- The electronic brake control module disables the ABS, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Diagnostic Aids

- Do not use a magnet to clean the wheel speed sensor magnetic encoder ring.
- Inspect the wheel speed sensor magnetic encoder ring for debris or corrosion.
- If two or more wheel speed sensors are inoperative, diagnose each wheel speed sensor individually.
- If any of the DTCs are set, refer to the Diagnostic Fault Information table for possible mechanical faults or conditions.
- If the customer comments that the ABS indicator is ON only during moist environmental conditions (rain, snow, vehicle wash, etc.), inspect the wheel speed sensor wiring for signs of water intrusion.

DTC C1287: REGENERATIVE BRAKING AXLE TORQUE ACHIEVED MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC C1287

Regenerative Braking Axle Torque Achieved Message Counter Incorrect

Circuit/System Description

The regenerative braking axle torque data is delivered from the hybrid powertrain control module to the electronic brake control module (EBCM) via serial data.

Conditions for Running the DTC

- Vehicle in Service Mode.
- The ignition voltage is greater than 10 V.

Conditions for Setting the DTC

The electronic brake control module detects that the regenerative braking axle torque signal value is not a continuous successor of the previous value.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The MIL indicator may be on or flashing.
- The traction control/stability control indicator turns ON.
- The Service Stability Trak message is displayed on the driver information center.
- The electronic brake control module disables the ABS, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

DTC Descriptors

DTC C1288

Autonomous Braking Accelerator Actual Position Status Message Counter Incorrect

Circuit/System Description

The autonomous braking accelerator actual position data is delivered from the engine control module (ECM) to the electronic brake control module (EBCM) via serial data.

Conditions for Running the DTC

- Vehicle in Service Mode.
- The ignition voltage is greater than 10 V.

Conditions for Setting the DTC

The electronic brake control module detects that the autonomous braking accelerator actual position signal value is not a continuous successor of the previous value.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The MIL indicator may be on or flashing.
- The traction control/stability control indicator turns ON.
- The Service StabiliTrak message is displayed on the driver information center.
- The electronic brake control module disables the ABS, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

DTC C1445: SYSTEM DISABLED INFORMATION STORED TEMPERATURE HIGH

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC C1445 54

System Disabled Information Stored Temperature High

Circuit/System Description

The electronic brake control module receives data from other modules; engine control module, body control module, 14 V accessory power module, hybrid powertrain control module 1, and hybrid powertrain control module 2. The multi-axis acceleration sensor and the steering wheel angle sensor are needed to perform brake control functions. The module must ensure that all serial data and sensor inputs are properly received and learned.

Conditions for Running the DTC

- Ignition voltage is greater than 10 V.
- Vehicle ON or Vehicle in Service Mode.

Conditions for Setting the DTC

DTC C1445 54

This diagnostics detects an over temperature condition with one of the twelve solenoids due to an extended ABS, traction control and vehicle stability event lasting more than 45 seconds.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The red brake indicator turns ON.
- The traction/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information center.

- The electronic brake control module disables the ABS, the dynamic rear proportioning, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- It may take two Vehicle ON cycles to clear this DTC.
- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Diagnostic Aids

- Check for hydraulic leaks, air in the brake system or incorrect brake bleed.
- Excessive traction control event for greater than 45 seconds.

Circuit/System Verification

DTC C1445 54

NOTE: This diagnostic detects an over temperature condition with 1 of the 12 solenoids due to an extended ABS, traction control and vehicle stability event lasting more than 45 seconds. This does not indicate a failure with the Electronic Brake Control Module.

1. Verify DTC C1445 54 does not set while operating the vehicle under normal driving conditions.

- **If the DTC sets**

Replace the K17 Electronic Brake Control Module.

- **If the DTC does not set**

2. All OK.

Repair Instructions

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC C144B

Electronic Control Unit Software

For symptom byte information refer to [Symptom Byte List](#)

Circuit/System Description

The electronic brake control module determines that the electronic park brake portion of the module is programmed incorrectly.

Conditions for Running the DTC

- Vehicle ON or Vehicle in Service Mode.

Conditions for Setting the DTC

The electronic brake control module is not properly programmed.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The traction/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed in the driver information center.
- The electronic brake control module disables the ABS, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.

- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Diagnostic Aids

A newly replaced electronic brake control module can set one or more DTC on its initial vehicle in service mode cycle.

Ground Terminal 46	-	U0129 00, U1833 00	-	-

Circuit/System Description

The traction control prime (fill) and isolation (return) solenoid valves are located internally to the brake pressure modulator. The electronic brake control module activates the valve relay to supply voltage to the valve solenoids. This voltage is referred to as the system voltage. The electronic brake control module activates

individual valve solenoids by grounding the valve solenoid control circuits. This verification is used to perform hydraulic checks at the normally open base brake valve, the front hydraulic circuit and the block.

Conditions for Running the DTC

- Vehicle ON or Vehicle in Service Mode.
- The ignition voltage is greater than 10 V.

Conditions for Setting the DTC

C158F

The electronic brake control module detects a general failure with the front hydraulic traction control circuit fill valve.

C1590

The electronic brake control module detects a general failure with the front hydraulic traction control circuit isolation valve.

C1591

The electronic brake control module detects a general failure with the rear hydraulic traction control circuit fill valve.

C1592

The electronic brake control module detects a general failure with the rear hydraulic traction control circuit isolation valve.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The red brake indicator turns ON.
- The traction/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information center.
- The electronic brake control module disables the ABS, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the K17 Electronic Brake Control Module. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminals listed below and ground:
 - Terminal 14
 - Terminal 46
 - **If 10 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify that a test lamp illuminates between the B+ circuit terminals listed below and ground.
 - Terminal 1
 - Terminal 30
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance or the short to ground in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp illuminates**
5. Vehicle in Service Mode.

6. Verify that a test lamp illuminates between the ignition circuit terminal 17 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ignition circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance or the short to ground in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp illuminates**
7. Replace the K17 Electronic Brake Control Module.

Repair Instructions

DTC C1594: ADAPTIVE CRUISE CONTROL BRAKING REQUEST - ACCELERATOR PEDAL POSITION NOT PLAUSIBLE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC C1594

Adaptive Cruise Control Braking Request - Accelerator Pedal Position Not Plausible

Circuit/System Description

Adaptive cruise control is allowed via serial data inputs from various modules to the active safety control module. The adaptive cruise control braking request signal is delivered from the active safety control module to the electronic brake control module (EBCM) via serial data.

Conditions for Running the DTC

- Vehicle in Service Mode.
- The ignition voltage is greater than 10 V.

Conditions for Setting the DTC

The electronic brake control module detects that the adaptive cruise control braking request signal value is not a continuous successor of the previous value.

Action Taken When the DTC Sets

- The ABS indicator turns ON.

- The MIL indicator may be on or flashing.
- The traction control/stability control indicator turns ON.
- The Service StabiliTrak message is displayed on the driver information center.
- The electronic brake control module disables the ABS, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Ground Terminal 46	-	P0560	P0563	P0560

Circuit/System Description

The electronic brake control module monitors two different blocks of memory to determine its capability to control the system shutdown process.

Conditions for Running the DTC

Vehicle ON or Vehicle in Service Mode.

Conditions for Setting the DTC

- Keep alive voltage regulator not functional.
- Processor loses complete battery power.
- Battery voltage is under 9 V and the vehicle is not moving.

Action Taken When the DTC Sets

- A warning indicator may be displayed.
- A driver information center message may be displayed.
- The electronic brake control module disables ABS, traction control system and vehicle stability enhancement system for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The electronic brake control module clears the history DTC when a current DTC is not detected in 40 consecutive drive cycles.

DTC P05FF: BRAKE PRESSURE SENSOR AND BRAKE PEDAL POSITION SENSOR CORRELATION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P05FF

Brake Pressure Sensor / Brake Pedal Position Sensor Correlation

Circuit/System Description

The K177 Brake Booster Control Module has an internal brake travel sensor. The K17 Electronic Brake Control Module (EBCM) communicates with the K177 Brake Booster Control Module to determine if the amount of travel by the internal brake travel sensor is equal to the amount of expected pressure.

Conditions for Running the DTC

- Vehicle in Service Mode.
- Ignition voltage is greater than 10 V.

Conditions for Setting the DTC

- The electronic brake control module detects the brake pressure is high when the internal brake travel sensor is reading low travel.
- The electronic brake control module detects the brake pressure is low when the internal brake travel sensor is reading high travel.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The red brake indicator turns ON.
- The traction/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information center.
- The electronic brake control module disables the ABS, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Circuit/System Verification

1. Verify no other DTCs are set.

- **If any DTCs are set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

- **If no DTCs are set**

NOTE: To ensure the complete brake modulator and high pressure accumulator pressure relief procedure is allowed to occur; the brake controller must see 1 pedal apply with the propulsion system enabled, followed by a proper shutdown without applying the brake pedal.

2. Vehicle ON, apply and release the brake pedal.

NOTE: Vehicle OFF, without applying the brake pedal ensure the brake modulator and high pressure accumulator pressure relief occurs. This process will take approximately 1-3 minutes.

3. Vehicle OFF, without applying the brake pedal.
4. Remove the remote keyless entry transmitter and close all of the vehicle doors. Wait approximately 1-3 minutes until the brake modulator and the high pressure accumulator pressure relief is complete and the vehicle powers down.
5. Vehicle in Service Mode.
6. Verify the scan tool parameters listed below are within 0 - 2 mm of each other as the brake pedal is applied:
 - Input Rod Position Sensor.
 - Output Rod Position Sensor.
 - Brake Pedal Position Calculated from Input Rod Position Sensor 1.
 - Brake Pedal Position Calculated from Input Rod Position Sensor 2.
 - **If the parameters are not within the specified range**

Replace the K177 Brake Booster Control Module.

- **If the parameters are within the specified range**

7. Inspect for binding brake pedal, correct mounting of the K177 Brake Booster Control Module, or for brake fluid leaks.

- **Were any of the above conditions found**

Repair as necessary.

- **If no conditions were found**

8. Perform a brake hydraulic system test, refer to [Hydraulic Brake System Diagnosis](#).

- **If the brake hydraulic system test does not pass**

Repair as necessary.

- **If the brake hydraulic system tests normal**

9. Replace the K177 Brake Booster Control Module.

10. Verify the DTC does not set while operating the vehicle within the Conditions for Running the DTC.

- **If the DTC sets**

Replace the K17 Electronic Brake Control Module.

- **If the DTC does not set**

11. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

DTC P062F

Control Module Long Term Memory Performance

Circuit/System Description

The electronic brake control module (EBCM) detects an internal malfunction.

Conditions for Running the DTC

- Vehicle ON or Vehicle in Service Mode.
- Ignition voltage is between 8 V and 16 V.

Conditions for Setting the DTC

The EBCM detects an internal failure or incomplete programming for more than 10 s.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The red brake indicator turns ON.
- The traction control/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information center.
- The electronic brake control module disables the ABS, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Scan Tool Reference

[Control Module References](#) for scan tool information

Diagnostic Aids

Low voltage or a momentary loss of power or ground to the EBCM may cause a DTC to set. Verify the following:

- The battery cables are clean and tight, and the battery is fully charged.
- The EBCM ground circuits do not have an open or high resistance.
- The EBCM power circuits do not have an open, short to ground, or high resistance.

Circuit/System Verification

1. Vehicle in Service Mode, clear the DTC information with a scan tool.
2. Verify no other DTCs are set.

- **If any other DTCs are set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) for further diagnosis.

- **If no other DTCs are set**

3. Verify DTC P0602 is not set.

- **If the DTCs is set**

1. Program the K17 Electronic Brake Control Module. Refer to [Control Module References](#) .

2. Verify DTC P0602 is not set.

- If the DTC is set, replace the K17 Electronic Brake Control Module.
- If the DTC is not set

3. All OK.

- **If none of the DTCs are set**

4. Verify DTC P0601, P0603, P0604, P0606, or P062F is not set.

- **If any of the DTCs are set**

Replace the K17 Electronic Brake Control Module.

- **If none of the DTCs are set**

5. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

DTC P0856: TRACTION CONTROL TORQUE REQUEST CIRCUIT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P0856

Traction Control Torque Request Signal Message Counter Incorrect

Circuit/System Description

When traction control is active, the electronic brake control module sends a serial data message to the engine control module requesting torque reduction. When certain electronic brake control module DTCs are set, the engine control module will not be able to perform the torque reduction for traction control. A serial data message is sent to the electronic brake control module indicating that traction control is not allowed.

Conditions for Running the DTC

Engine running.

Conditions for Setting the DTC

The engine control module detects a fault that prevents it from performing a traction control function and sends a serial data message to the electronic brake control module indicating that torque reduction is not allowed.

Action Taken When the DTC Sets

- The traction/stability control indicator turns ON.
- The electronic brake control module disables the traction control and stability control for the duration of the ignition cycle.

Conditions for Clearing the DTC

- A current DTC clears when the diagnostic runs and passes.
- The electronic brake control module will turn OFF the indicator in the next ignition cycle.

DTC P15F8: AUTOMATIC BRAKING ENGINE TORQUE REQUEST SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P15F8

Automatic Braking Engine Torque Request Signal Message Counter Incorrect

Circuit/System Description

The electronic brake control module and the engine control module simultaneously control the vehicle performance. During a automatic brake event the electronic brake control module sends a serial data message to the engine control module requesting torque reduction. If the engine control module receives corrupt data from the electronic brake control module, DTC P15F8 will set in the engine control module. The engine control module then sends a serial data message to the electronic brake control module that torque reduction is not allowed.

Conditions for Running the DTC

- The ignition is ON.
- Ignition voltage is greater than 8 V.

Conditions for Setting the DTC

The engine control module detects a corrupted data message from the electronic brake control module.

Action Taken When the DTC Sets

- The ABS remains functional.
- DTC P15F8 is a Type B DTC.
- The traction Off indicator turns ON.
- The traction/stability control indicator turns ON.
- The Service Stabilitrak message may be displayed on the driver information center.

Conditions for Clearing the DTC

DTC P15F8 is a Type B DTC.

Diagnostic Aids

Inspect the serial data circuits and connections at the engine control module and the electronic brake control module. They should be free from sources of electromagnetic interference and the connections should be clean

and tight.

DTC P15FD: WHEEL SPEED SENSOR MESSAGE SEQUENCE INCORRECT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P15FD

Wheel Speed Sensor Message Sequence Incorrect

Circuit/System Description

The wheel speeds are detected by active wheel speed sensors. Each wheel speed sensor receives a 12 V reference voltage from the electronic brake control module (EBCM) and provides an alternating current square wave signal to the EBCM. As the wheel spins, the EBCM uses the frequency of the square wave signal to calculate the wheel speed. The EBCM sends the wheel speed information as a high speed controller area network (CAN) serial data message.

Conditions for Running the DTC

Ignition ON

Conditions for Setting the DTC

A supervised periodic message that includes the wheel speed serial data has not been received.

Action Taken When the DTC Sets

Specific subsystems will not function or operate in degraded mode.

Conditions for Clearing the DTC

A current DTC clears when the diagnostic runs and passes.

Scan Tool Reference

[Control Module References](#) for scan tool information

Diagnostic Aids

- This DTC can be set due to an incorrect part wheel speed sensor installed.
- Inspect the wheel encoder ring for rust or corrosion.
- If the customer comments that the ABS indicator is ON only during moist environmental conditions (rain, snow, vehicle wash, etc.), inspect the wheel speed sensor wiring for signs of water intrusion.

Circuit/System Verification

Ignition ON, observe the scan tool EBCM Wheel Speed Sensor parameters. The reading should be the same speed on all sensors when driving in a straight line at a speed greater than 20 km/h (13 MPH).

Circuit/System Testing

1. Ignition ON.
2. Verify that DTC C0035, C0040, C0045, or C0050 is not set in the EBCM.

- **If any listed DTC is set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) to diagnose that DTC prior to this diagnostic.

- **If any listed DTC is not set**

3. Replace the K17 Electronic Brake Control Module.
4. Verify the DTC does not set while operating the vehicle under the Conditions for Running the DTC.

- **If the DTC sets**

Replace the module that set the DTC.

- **If the DTC does not set**

5. All OK.

DTC P1B12: DRIVER INTENDED BRAKING TORQUE SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for a overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P1B12

Driver Intended Braking Torque Signal Message Counter Incorrect

Circuit/System Description

The electronic brake control module provides brake pedal position information to the engine control module, via the serial data circuit. The engine control module monitors a series of 16 rolling counts, with each count assigned a value, when the engine control module determines that too many of the counts have an incorrect value, the engine control module sets DTC P1B12.

Conditions for Running the DTC

- The propulsion system is active.
- DTC P1B12 runs continuously when the above condition is met.

Conditions for Setting the DTC

The engine control module detects that 10 of the 16 rolling counts have an incorrect value.

Action Taken When the DTC Sets

DTC P1B12 is a Type C DTC.

Conditions for Clearing the DTC

DTC P1B12 is a Type C DTC.

Diagnostic Aids

- DTC P1B12 is an informational DTC.
- Verify the electronic brake control module and engine control module contain the latest calibrations.
- Diagnose all other engine control module DTCs prior to DTC P1B12.
- Find out from the customer the conditions under which the DTC was set. This information may help duplicate the concern like the specific number of brake pedal applies in a row prior to the fault set.

DTC P215A: VEHICLE SPEED-WHEEL SPEED CORRELATION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.

[Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P215A

Vehicle Speed-Wheel Speed Correlation

Diagnostic Fault Information

Component	Condition	DTC
Wheel Speed Sensor	• Loose or improperly mounted sensor • Physical damage • Debris on the wheel speed sensor or the encoder ring • Loose or worn wheel bearing • Air gap between the wheel speed sensor and the encoder ring too large • Water intrusion in the wiring harness • Incorrect wheel/tire combination	C0555, C0556, C0557, C0558, P215A

Circuit/System Description

The wheel speeds are detected by active wheel speed sensors and encoder rings. The encoder rings consist of permanent magnets located in the hub. As the wheel spins the magnetic encoder ring rotates and passes by the wheel speed sensor head; which generates a sign wave in the wheel speed sensor. Each wheel speed sensor receives ignition voltage from the electronic brake control module and provides an alternating current square wave signal to the electronic brake control module. The electronic brake control module uses the frequency of the signals to calculate the wheel speeds.

Conditions for Running the DTC

- Vehicle On or Vehicle in Service Mode
- Ignition voltage is greater than 10 V.

Conditions for Setting the DTC

P215A

- Loose or improperly mounted sensor
- The tone ring may be demagnetized
- Water intrusion in the wiring harness
- Debris on the wheel speed sensor or the tone ring

- Missing tooth or teeth on the wheel speed sensor tone ring
- Air gap between the wheel speed sensor and the tone ring too large
- Electrical magnetic interference with the wheel speed sensor harness

Actions Taken when the DTC Sets

- The ABS indicator turns ON.
- The traction/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information center.
- The electronic brake control module disables the ABS, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Diagnostic Aids

- Do not use a magnet to clean the wheel speed sensor magnetic encoder ring.
- Inspect the wheel speed sensor magnetic encoder ring for debris or corrosion.
- If two or more wheel speed sensors are inoperative, diagnose each wheel speed sensor individually.
- If any of the DTCs are set, refer to the Diagnostic Fault Information table for possible mechanical faults or conditions.
- If the customer comments that the ABS indicator is ON only during moist environmental conditions (rain, snow, vehicle wash, etc.), inspect the wheel speed sensor wiring for signs of water intrusion.
- An incorrect wheel and tire size or mounting issue may also cause DTC P215A to set.

DTC P2299: BRAKE PEDAL POSITION/ACCELERATOR PEDAL POSITION INCOMPATIBLE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P2299

Brake Pedal Position/Accelerator Pedal Position Incompatible

Circuit/System Description

The body control module monitors the brake pedal position sensor and sends a serial data message to the both the electronic brake control module and engine control modules when the brake pedal is applied. The engine control module compares the correlation between the brake pedal positions and the brake control brake pedal position sensor to sense the driver's application of the brake pedal.

Conditions for Running the DTC

- Vehicle ON
- The brake pedal is applied.
- The ignition voltage is greater than 10 V.
- The accelerator pedal position is greater than 20 %.

Conditions for Setting the DTC

The brake pedal position sensor signal is not applied while the brake control brake pedal position sensor indicates the brake pedal is applied.

Action Taken When the DTC Sets

A driver information center message and/or a warning indicator will not be displayed.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Diagnostic Aids

- DTC P2299 may set if the brake pedal is applied while accelerating.
- Diagnose all other stop lamp DTCs or Symptoms prior to performing this diagnostic procedure.

SYMPTOMS - ANTILOCK BRAKE SYSTEM

NOTE: The following steps must be completed before using the symptom tables.

1. Perform the [Diagnostic System Check - Vehicle](#) before using the symptom tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system description and operation in order to familiarize yourself with the system functions. Refer to [ABS Description and Operation](#).

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the ABS. Refer to [Checking Aftermarket Accessories](#).
- Inspect the easily accessible or visible system components, for obvious damage or conditions, which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#).

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [ABS Indicator Malfunction](#)
- [Traction Control/Stability Control Indicator Malfunction](#)

ABS INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

Circuit/System Description

The instrument cluster turns ON the ABS indicator for 5 seconds after Vehicle in Service Mode or when the electronic brake control module detects a fault and sends a serial data message to the instrument cluster commanding the indicator ON.

Perform the [Diagnostic Repair Verification](#) after completing the repair.

[Control Module References](#) for Instrument Cluster replacement, programming and setup

REPAIR INSTRUCTIONS

CONNECTOR RECONNECTION - WHEEL SPEED SENSOR

Special Tools

EL-35616 Terminal Test Probe Kit

For equivalent regional tools, refer to [Special Tools](#) .

When the condition is not currently present, but is indicated in DTC history, the cause may be intermittent. An intermittent may also be the cause when there is a customer complaint, but the symptom cannot be duplicated. Refer to the Symptom Table of the system that is suspect of causing the condition before trying to locate an intermittent condition.

Most intermittent conditions are caused by faulty electrical connections or wiring. Inspect for the following items:

- Loose, corroded, or painted terminal stud/fastener
- Wiring broken inside the insulation
- Poor connection between the male and female terminal at a connector
- A terminal not seated all the way into the connector body
- Poor terminal to wire connection - Some conditions which fall under this description are poor crimps, poor solder joints, crimping over the wire insulation rather than the wire itself, and corrosion in the wire to terminal contact area, etc.
- Pierced or damaged insulation can allow moisture to enter the wiring causing corrosion. The conductor can corrode inside the insulation, with little visible evidence. Look for swollen and stiff sections of wire in the suspect circuits.
- Wiring which has been pinched, cut, or its insulation rubbed through may cause an intermittent open or short as the bare area touches other wiring or parts of the vehicle.
- Wiring that comes in contact with hot or exhaust components
- Refer to [Inducing Intermittent Fault Conditions](#) in order to duplicate the conditions required, in order to verify the customer concern.
- Refer to [Testing for Electrical Intermittents](#) for test procedures to detect intermittent open, high resistance, short to ground, and short to voltage conditions.
- Refer to [Scan Tool Snapshot Procedure](#) for advanced intermittent diagnosis and Vehicle Data Recorder operation.

Testing for Terminal Fretting

Some intermittent conditions can be caused by wire terminal fretting corrosion. Fretting corrosion is a build-up of insulating, oxidized wear debris that can form when there is a small motion between electrical contacts. The oxidized wear debris can pile up enough at the electrical contact spots that the electrical resistance across the connection increases. Movement between the contacting surfaces as small as 10 to 100 microns can cause fretting. To put this in perspective, a sheet of paper is about 100 microns thick, so fretting motion is small and hard to see. Vibration and thermal expansion/contraction are the main sources that create fretting motion. Since vehicles vibrate and can experience large temperature swings, they are a good source for fretting motion. Tin, copper, nickel, and iron surfaces are all susceptible to fretting corrosion. Fretting corrosion can be difficult to see but it looks like small, dark smudges on the terminals contact surface.

To correct a fretting condition disconnect the suspect connector and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087) to both sides of the connector terminals. Then reconnect the connector and wipe away any excess lubricant. This will correct the additional terminal contact resistance due to the terminal fretting corrosion.

Testing for Proper Terminal Contact

It is important to test terminal contact at the component and any inline connectors before replacing a suspect component. Mating terminals must be inspected to ensure good terminal contact. A poor connection between the male and female terminal at a connector may be the result of contamination or deformation.

Contamination may be caused by the connector halves being improperly connected. A missing or damaged connector seal, damage to the connector itself, or exposing the terminals to moisture and dirt can also cause contamination. Contamination, usually in the underhood or underbody connectors, leads to terminal corrosion, causing an open circuit or intermittently open circuit.

Deformation is caused by probing the mating side of a connector terminal without the proper adapter. Always use the **EL-35616** kit when probing connectors. Other causes of terminal deformation are improperly joining the connector halves, or repeatedly separating and joining the connector halves. Deformation, usually to the female terminal contact tang, can result in poor terminal contact causing an open or intermittently open circuit.

Testing for Proper Terminal Contact in Bussed Electrical Centers

It is very important to use the correct test adapter when testing for proper terminal contact of fuses and relays in a bussed electrical center. Use the **EL-35616** kit to test for proper terminal contact. Failure to use the **EL-35616** kit can result in improper diagnosis of the bussed electrical center.

Follow the procedure below in order to test terminal contact:

1. Separate the connector halves.
2. Visually inspect the connector halves for contamination. Contamination may result in a white or green build-up within the connector body or between terminals. This causes high terminal resistance, intermittent contact, or an open circuit. An underhood or underbody connector that shows signs of contamination should be replaced in its entirety: terminals, seals, and connector body.
3. Using an equivalent male terminal/terminated lead, verify that the retention force is significantly different between a known good terminal and the suspect terminal. Replace the female terminal in question.

Flat Wire Connectors

There are no serviceable parts for flat wire connectors on the harness side or the component side.

Follow the procedure below in order to test terminal contact:

1. Remove the component in question.
2. Visually inspect each side of the connector for signs of contamination. Avoid touching either side of the connector as oil from your skin may be a source of contamination as well.
3. Visually inspect the terminal bearing surfaces of the flat wire circuits for splits, cracks, or other imperfections that could cause poor terminal contact. Visually inspect the component side connector to ensure that all of the terminals are uniform and free of damage or deformation.
4. Insert the appropriate adapter into the flat wire harness connector in order to test the circuit in question.

Control Module/Component Voltage and Grounds

Poor voltage or ground connections can cause widely varying symptoms.

- Test all control module voltage supply circuits. Many vehicles have multiple circuits supplying voltage to a control module. Other components in the system may have separate voltage supply circuits that may also need to be tested. Inspect connections at the module/component connectors, fuses, and any intermediate connections between the voltage source and the module/component. A test lamp or a DMM may indicate that voltage is present, but neither tests the ability of the circuit to carry sufficient current. Operate the component to test the ability of the circuit to carry sufficient current. Refer to [Circuit Testing](#) , and [Power Distribution Schematics](#) .
- Test all control module ground and system ground circuits. The control module may have multiple ground circuits. Other components in the system may have separate grounds that may also need to be tested. Inspect grounds for clean and tight connections at the grounding point (screw or stud). Inspect the connections at the component and in splice packs, where applicable. Operate the component to test the ability of the circuit to carry sufficient current. Refer to [Circuit Testing](#) , and [Ground Distribution Schematics](#) .

Temperature Sensitivity

- An intermittent condition may occur when a component/connection reaches normal operating temperature. The condition may occur only when the component/connection is cold, or only when the component/connection is hot.
- Freeze Frame, Failure Records, Snapshot, or Vehicle Data Recorder data may help with this type of intermittent condition, where applicable.
- If the intermittent is related to heat, review the data for a relationship with the following:
 - High ambient temperatures
 - Underhood/engine generated heat
 - Circuit generated heat due to a poor connection, or high electrical load
 - Higher than normal load conditions, towing, etc.
- If the intermittent is related to cold, review the data for the following:
 - Low ambient temperatures - In extremely low temperatures, ice may form in a connection or component. Inspect for water intrusion.
 - The condition only occurs on a cold start.

- The condition goes away when the vehicle warms up.
- Information from the customer may help to determine if the trouble follows a pattern that is temperature related.
- If temperature is suspected of causing an intermittent fault condition, attempt to duplicate the condition. Refer to [Inducing Intermittent Fault Conditions](#) in order to duplicate the conditions required.

Electromagnetic Interference and Electrical Noise

Some electrical components/circuits are sensitive to electromagnetic interference or other types of electrical noise. Inspect for the following conditions:

- A mis-routed harness that is too close to high voltage/high current devices such as secondary ignition components, motors, generator etc. - These components may induce electrical noise on a circuit that could interfere with normal circuit operation.
- Electrical system interference caused by a malfunctioning relay, or a control module driven solenoid or switch - These conditions can cause a sharp electrical surge. Normally, the condition will occur when the malfunctioning component is operating.
- Installation of non-factory or aftermarket add on accessories such as lights, 2-way radios, amplifiers, electric motors, remote starters, alarm systems, cell phones, etc. - These accessories may create interference in other circuits while operating and the interference would disappear when the accessory is not operating. Refer to [Checking Aftermarket Accessories](#) .
- Test for an open diode across the A/C compressor clutch and for other open diodes. Some relays may contain a clamping diode.
- The generator may be allowing AC noise into the electrical system.

Incorrect Control Module

- There are only a few situations where reprogramming a control module is appropriate:
 - A new service control module is installed.
 - A control module from another vehicle is installed.
 - Revised software/calibration files have been released for this vehicle.

NOTE: **DO NOT re-program the control module with the SAME software/calibration files that are already present in the control module. This is not an effective repair for any type of concern.**

- Verify that the control module contains the correct software/calibration. If incorrect programming is found, reprogram the control module with the most current software/calibration. Refer to [Control Module References](#) for replacement, setup, and programming.

ANTILOCK BRAKE SYSTEM AUTOMATED BLEED

WARNING: Refer to [Brake Fluid Irritant Warning](#) .

CAUTION: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#) .

NOTE: Before performing the ABS Automated Bleed Procedure, first perform a

pressure bleed of the base brake system. Refer to [Hydraulic Brake System Bleeding](#) . The automated bleed procedure is recommended when one of the following conditions exist:

- Base brake system bleeding does not achieve the desired pedal height or feel
- Extreme loss of brake fluid has occurred
- Air ingestion is suspected in the secondary circuits of the brake modulator assembly

The ABS Automated Bleed Procedure uses a scan tool to cycle the system solenoid valves and run the pump in order to purge any air from the secondary circuits. These circuits are normally closed off, and are only opened during system initialization at vehicle start up and during ABS operation. The automated bleed procedure opens these secondary circuits and allows any air trapped in these circuits to flow out toward the brake corners.

Performing the Automated Bleed Procedure

CAUTION: The Auto Bleed Procedure may be terminated at any time during the process by pressing the EXIT button. No further Scan Tool prompts pertaining to the Auto Bleed procedure will be given. After exiting the bleed procedure, relieve bleed pressure and disconnect bleed equipment per manufacturers instructions. Failure to properly relieve pressure may result in spilled brake fluid causing damage to components and painted surfaces.

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove all four tire and wheel assemblies. Refer to [Tire and Wheel Removal and Installation](#) .
3. Inspect the brake system for leaks and visual damage. Repair or replace components as needed.
4. Lower the vehicle.
5. Inspect the battery state of charge. Refer to [Battery Inspection/Test](#) .
6. Install a scan tool.
7. Place the Power button in Service Only Mode.
8. With the scan tool, establish communications with the ABS system. Select Control Functions. Select Automated Bleed from the Control Functions menu.
9. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
10. Following the directions given on the scan tool, pressure bleed the base brake system. Refer to [Hydraulic Brake System Bleeding](#) .
11. Follow the scan tool directions until the desired brake pedal height is achieved.
12. If the bleed procedure is aborted, a malfunction exists. Perform the following steps before resuming the bleed procedure:
 - If a DTC is detected, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) , and diagnose the appropriate DTC.
 - If the brake pedal feels spongy, perform the conventional brake bleed procedure again. Refer to [Hydraulic Brake System Bleeding](#) .

13. When the desired pedal height is achieved, press the brake pedal to inspect for firmness.
14. Install the tire and wheel assemblies. Refer to [Tire and Wheel Removal and Installation](#) .
15. Lower the vehicle.
16. Remove the scan tool.
17. Inspect the brake fluid level. Refer to [Master Cylinder Reservoir Filling](#) .
18. Road test the vehicle while inspecting that the pedal remains high and firm.

STEERING WHEEL ANGLE SENSOR CENTERING

The steering angle sensor does not require centering often. Centering of the steering angle sensor might be required after certain service procedures are performed. Some of these procedures are as follows:

- Wheel alignment
- Steering gear replacement
- Steering column replacement
- Collision or other physical damage
- Power steering control module replacement
- Electronic brake control module replacement

The steering angle sensor centering procedure can be completed with a scan tool using the following steps:

1. Using the steering wheel, align and center the front wheels forward.
2. Apply the parking brake, or set the transmission in Park.
3. Install the scan tool to the data link connector.
4. Vehicle in Service Mode.
5. With the scan tool select the Power Steering Control Module.
6. Select the Steering Wheel Angle Sensor Centering under Configuration/Reset Functions list.
7. Follow the scan tool directions to complete the learn procedure.
8. With the scan tool select the Electronic Brake Control Module.
9. Select the Steering Wheel Angle Sensor Centering under Configuration/Reset Functions list.
10. Follow the scan tool directions to complete the learn procedure.
11. Clear any DTCs that may be set.
12. Vehicle OFF.

VEHICLE YAW SENSOR LEARN (WITH UGN)

The yaw rate sensor does not require calibration often. Calibrating the yaw rate sensor might be required after certain service procedures are performed. Some of these procedures are as follows:

- Yaw Rate Sensor replacement
- Electronic Brake Control Module replacement
- Inflatable Restraint Sensing and Diagnostic Module replacement

The yaw rate sensor learn procedure can be completed with a scan tool using the following steps:

1. Place vehicle on a level surface
2. Apply the parking brake, or set the transmission in the Park position.
3. Install the scan tool to the data link connector.
4. Ignition ON/Vehicle in Service Mode.
5. Select Yaw Rate Sensor Learn in the Electronic Brake Control Module Configuration/Reset Functions list.

6. Follow the scan tool directions to complete the calibration procedure.
7. Clear any DTCs that may be set.

VEHICLE YAW SENSOR LEARN (WITHOUT UGN)

The yaw rate sensor does not require calibration often. Calibrating the yaw rate sensor might be required after certain service procedures are performed. Some of these procedures are as follows:

- Inflatable Restraint Sensing and Diagnostic Module replacement

The yaw rate sensor learn procedure can be completed with a scan tool using the following steps:

1. Place vehicle on a level surface
2. Apply the parking brake, or set the transmission in the Park position.
3. Install the scan tool to the data link connector.
4. Ignition ON, engine OFF.
5. Select Yaw Rate Sensor Learn in the Inflatable Restraint Sensing and Diagnostic Module Configuration/Reset Functions list.
6. Follow the scan tool directions to complete the calibration procedure.
7. Clear any DTCs that may be set.

DESCRIPTION AND OPERATION

ABS DESCRIPTION AND OPERATION

This vehicle is equipped with a Bosch ABS/SCB/TC/VSC module.

This module provides the following vehicle performance enhancement systems:

- Antilock Brake System (ABS)
- Electric Parking Brake (EBP apply and EPB release (automatic))
- Extended Hill Start Assist (EHSA)
- Regenerative Braking (in conjunction with the Eboost module)
- Electronic Brake Distribution
- Traction Control (TC)
- Vehicle Stability Control (VSC)

The following components are involved in the operation of the above systems:

- Electronic brake control module (EBCM) - The EBCM controls the system functions and detects failures.

The EBCM contains the following components:

- System relay - The system relay is internal to the EBCM. The system relay is energized when the power button is placed in ON/RUN or a remote function actuation (RFA) commands remote START. The system relay supplies battery positive voltage to the valve solenoids and to the ABS pump motor. This voltage is referred to as system voltage.
- Solenoids - The solenoids are commanded ON and OFF by the EBCM to operate the appropriate

valves in the brake pressure modulator valve.

- Brake pressure modulator valve - The brake pressure modulator valve uses a 4-circuit configuration to control hydraulic pressure to each wheel independently.

The brake pressure modulator valve contains the following components:

- ABS pump motor and pump
- Isolation valves
- Dump valves
- Electronic hydraulic control unit
- Steering angle sensor--The EBCM receives serial data message inputs from the steering angle sensor. The steering angle sensor signal is used to calculate the desired yaw rate. The steering angle sensor is mounted internally to the electric power steering gear.
- Traction control switch--Traction control and stability control are manually disabled or enabled by pressing the traction control switch.
- Multi-axis acceleration sensor--The yaw rate, lateral acceleration and longitudinal acceleration sensors are combined into one multi-axis acceleration sensor. The EBCM receives serial data message inputs from the yaw rate, lateral acceleration and longitudinal acceleration sensor and activates stability control depending on multi-axis acceleration sensor input.

Depending on vehicle options, the vehicle multi-axis sensor may be installed internal to the inflatable restraint sensing diagnostic module, separately externally, or a combination of both. Confirm with vehicle RPO codes and schematics.

- Wheel speed sensors - The wheel speeds are detected by active wheel speed sensors and encoder rings. The encoder ring consists of permanent magnets. Each wheel speed sensor receives ignition voltage from the electronic brake control module (EBCM) and provides a DC square wave signal back to the module. As the wheel spins, the EBCM uses the frequency of the square wave signal to calculate the wheel speed.
- Electronic park brake motors - Controlled by the EBCM and attached to each rear caliper.

General Antilock Brake Operation

General Operation

The Bosch ESPheV Hydraulic Unit and iBooster work in conjunction to provide both friction and regenerative braking. The iBooster Brake Booster assembly works very similarly to a standard vacuum booster, except brake boost is provided by an electric motor instead of engine vacuum. When the driver applies the brake pedal the iBooster and master cylinder delivers fluid to the ESPheV unit. The ESPheV unit then balances the friction and regenerative braking via a series of valves and a low pressure fluid line that is connected to the brake fluid reservoir. The ESPheV unit can move fluid to and from the reservoir via this low pressure line to meet the drivers braking demand with friction that cannot be achieved via regenerative braking. In order to balance the brake pedal feel of the driver, the iBooster braking support force is changed to match the brake fluid pressure in the system. When there is no regenerative braking possible (i.e. standstill), the separation valve inside the ESPheV is closed and the master cylinder only supplies brake fluid to the front axle. The rear axle braking demand is supplied by the ESP pump pulling fluid from the reservoir.

A pressure transducer on the primary master cylinder circuit (Master Cylinder Pressure), a pedal travel sensor

on the input piston assembly, and the brake switch are inputs into the electronic control unit. These inputs are used to determine the driver's braking intent which is used to control the torque applied to the wheels.

Base Brakes (Friction Braking)

The braking torque applied to the wheels in proportion to the driver's braking intent is achieved with a combination of regenerative braking from the powertrain and hydraulically applied friction braking controlled by the electro-hydraulic control unit. The friction braking achieved by the electro-hydraulic control unit controlling a combination of valves and ESP Pump Motor Duty in a way that moves fluid in and out of the wheels via the low pressure line connected to the brake fluid reservoir. The Bosch ESPheV system is designed to be used with a Bosch iBooster in order to achieve seamless driver brake pedal feel.

Base Brake Valves (No Valve Action)

The Separation Valve (SV) and Pressure Control Relief (PCR) Valves are open and closed respectively when they are not being controlled. In this state the brake fluid delivered by the master cylinder is sent directly to the wheels. This mode is used during a failsafe state to ensure proper friction braking and during the first apply of a new vehicle power cycle for diagnostics.

Base Brake Valves (Regenerative Braking)

When regenerative braking is available from the electric powertrain, the ESPheV unit will try to utilize this as much as possible. It does this by leaving the SV valve open and opening the PCR valve to return the brake fluid in the system to the brake fluid reservoir. If the regenerative braking is not able to meet the driver brake demand, the fluid can be reintroduced into the system by the ABS Pump pulling fluid from the reservoir. In order to match the driver brake pedal feel with the amount of fluid in the brake system, the iBooster support force is adjusted to match the expected feel.

Base Brake Valves (No Regenerative Braking)

When there is no regenerative braking available, i.e. vehicle is at standstill or very low speed, the SV valve will close with a driver brake apply. The SV valve closing diverts all the fluid from the master cylinder to the front brakes. The rear brake fluid will be pulled from the brake fluid reservoir via the low pressure line by the ABS Pump.

Electronic Brake Control Feature Descriptions

Antilock Braking System

The ABS system includes one hydraulic modulator that is capable of performing ABS and Electronic Brake force Distribution (EBD) functions. The ABS monitors wheel speeds and other select vehicle parameters. The ABS and EBD operations shall meet the brake balance requirements defined by four regions of friction utilization and Z critical parameter in the base brake SSTs. The EBD shall balance brake forces both longitudinally and laterally at full speed range. This function shall improve vehicle stability during normal braking by means of all corners brake pressure control without the use of a conventional mechanical proportioning valve(s). In addition, the included sub-functions (such as split coefficient yaw control and Cornering Brake Control - CBC) have to reduce unwanted yawing while braking in any condition (straight-line as well as any cornering). When braking on straight line homogeneous road surface the EBD shall provide optimum front and rear brake balance and control the rear brakes with equal pressure. During braking in a turn or steering while braking the EBD shall provide appropriate side-to-side brake proportioning through CBC to

optimize vehicle deceleration and meet vehicle stability specified in ABS vehicle performance requirements. The ECU and relays are integral to the hydraulic modulator.

Straight Line Stability (SLS)

SLS is used when vehicles exhibit excess yaw during straight line non-ABS, or threshold, brake applies. Vehicles with short wheelbases often exhibit this behavior. Straight Line Stability control shall have the capability to adjust front and rear brake corner pressures to assist the driver to maintain intended straight line vehicle path.

Enhanced Corner Brake Control (ECBC)

Enhanced Corner Brake Control shall have the ability to detect vehicle path deviation during very slight cornering maneuvers. Corner Brake Control may not engage in these maneuvers because the turn is not big enough. Also, ECBC shall integrate EBD and CBC to control both front and rear inner wheels to maintain vehicle stability.

Panic Brake Assist (PBA)

PBA detects that the driver intent is to stop the vehicle as quickly as possible, but does not apply sufficient brake pressure to do so. The feature will detect this driver intent then actively apply brake pressure to maximum pressure, thus activating the ABS system and stopping the vehicle as quickly as possible.

Hydraulic Fade Compensation (HFC)

The Hydraulic Fade Compensation (HFC) function detects a fading brake condition and activates the ESC modulator to increase the brake pressure above current master cylinder pressure from the driver apply. Once activated, HFC will drive all wheels into ABS. Built on a brake disc/pad temperature model, brake pressure and deceleration rate, brake pressure will be added to the already applied pressure from the driver. This increases the total brake pressure in the system and enhancing stopping distance in fading situations. The driver will experience fading brakes while using low or medium brake pedal force application. The HFC will activate only during high brake pedal force application.

Engine Drag Control (EDC)

This feature is designed to mitigate drop-throttle-oversteer. During maximum cornering while applying throttle, the vehicle could exhibit oversteer when the driver quickly releases the throttle. This feature will slowly reduce the engine torque in order to maintain vehicle stability.

Engine Torque Steer Control

Engine Torque Steer Control uses engine torque reductions to minimize torque steer. This is a pre-emptive engine torque reduction used on vehicles that exhibit excessive torque steer during large accelerator pedal inputs. This feature will also improve the Intersection maneuver (standing launch with 90 deg turn) performance.

Extended Hold Hill Start Assist (EHHSA)

Extended Hold Hill Start Assist is a feature that will hold the vehicle while on a grade, to prevent the vehicle from rolling down the hill. This feature will activate the Electronic Park Brake under driver exist scenarios.

Dynamic Braking with Electronic Park Brake

Dynamic Braking with the Electronic Park Brake (EPB) provides autonomous braking when the EPB switch is pressed when the vehicle is in motion. With the use of this feature, if the EPB switch is pressed while the vehicle is moving, the EBCM will apply braking at all 4 corners until the vehicle is stopped, then the EPB will apply and EBCM will release pressure

Reduced Boost Ratio During ABS (RBR)

On brake by wire systems, it is possible to reduce the amount of pressure applied by the system upstream of the wheel valves to improve ABS wheel control on low μ surfaces. This in essence reduces the amount of driver applied pressure when low μ ABS is detected. The overall goal of this feature is to improve ABS feel.

EV Powerhop and Powertrain Mount Control

Powerhop is defined as an oscillation of the driven wheels due to acceleration on high coefficient surfaces. This wheel oscillation causes the vehicle to bounce resulting in driver discomfort, failure of driveline components and potentially other damage to the vehicle. Powertrain Mount Resonance is also related to wheel oscillation. With the TCS feature "ON", power hop shall be detected using wheel speed sensor signals. With the TCS feature "OFF", the EBCM and ECM shall be required to mitigate power hop. If the vehicle is exhibiting this signature, the traction control system will attenuate powerhop by reducing engine torque and applying brake pressure.

Vehicle Stability Control

Stability control provides added stability during aggressive maneuvers. Yaw rate is the rate of rotation about the vehicle's vertical axis. The stability control is activated when the EBCM determines that the desired yaw rate does not match the actual yaw rate as measured by the yaw rate sensor.

The desired yaw rate is calculated by the EBCM using the following inputs:

- Steering wheel position
- Vehicle speed
- Lateral acceleration

The difference between the desired yaw rate and the actual yaw rate is the yaw rate error, which is a measurement of oversteer or understeer. When a yaw rate error is detected, the EBCM attempts to correct the vehicle's yaw motion by applying brake pressure to one or more of the wheels. The amount of applied brake pressure varies, depending on the correction required.

Power-up Self-Test

The electronic brake control module (EBCM) is able to detect many malfunctions whenever the ignition is ON. However, certain failures cannot be detected unless active diagnostic tests are performed on the components. Shorted solenoid coil or motor windings, for example, cannot be detected until the components are commanded ON by the EBCM. Therefore, a power-up self-test is required at the beginning of each ignition cycle to verify correct operation of components before the various control systems can be enabled. The EBCM performs the power-up self-test when the ignition is first turned ON. The system relay, solenoids and the antilock brake system (ABS) pump motor are commanded ON and OFF to verify proper operation and the EBCM verifies the ability to return the system to base braking in the event of a failure. The power-up self-test may be heard by the

driver, depending on how soon the engine is cranked and started after turning ON the ignition.

Driver Information Indicators

The following indicators are used to inform the driver of several different factors.

Brake Warning Indicator

The instrument panel cluster illuminates the brake warning indicator when the following occurs.

- The electronic brake control module (EBCM) detects that the park brake is engaged. The instrument panel cluster receives a serial data message from the BCM requesting illumination. The brake warning indicator flashes at a rate of approximately twice per second when the park brake is engaged.
- The electronic brake control module (EBCM) detects a low brake fluid condition or a base brake pressure differential and sends a serial data message to the instrument panel cluster requesting illumination.
- The instrument panel cluster performs the bulb check.
- The EBCM detects an antilock brake system (ABS)-disabling malfunction which also disables electronic brake distribution and sends a serial data message to the instrument panel cluster requesting illumination.

ABS Indicator

The instrument panel cluster illuminates the ABS indicator when the following occurs:

- The electronic brake control module (EBCM) detects an ABS-disabling malfunction and sends a serial data message to the instrument panel cluster requesting illumination.
- The instrument panel cluster performs the bulb check.
- The instrument panel cluster detects a loss of serial data communication with the EBCM.
- A DTC is set during the previous ignition cycle which requires a United Nations Economic Commission for Europe regulation number 13 (ECE 13) response at the beginning of the current ignition cycle. The EBCM sends a serial data message to the instrument panel cluster requesting illumination.

Traction Control/Stability Control Indicator

The instrument cluster turns the traction control/stability control indicator ON when the following occurs:

- The electronic brake control module (EBCM) detects an ABS/TC/VSC-disabling malfunction and sends a serial data message to the instrument panel cluster requesting illumination.
- The instrument panel cluster performs the bulb check.
- The instrument panel cluster detects a loss of serial data communication with the EBCM.
- A DTC is set during the previous ignition cycle which requires a United Nations Economic Commission for Europe regulation number 13 (ECE 13) response at the beginning of the current ignition cycle. The EBCM sends a serial data message to the instrument panel cluster requesting illumination.
- The EBCM is actively controlling propulsive torque or brake torque due to a loss of traction or vehicle stability event.
- The TC/VSC system has been manually disabled by the vehicle operator.

United Nations Economic Commission for Europe Regulation Number 13 (ECE 13) Response

The electronic brake control module (EBCM) illuminates the antilock brake system (ABS) indicator when a malfunction which disables ABS is detected. Usually, the ABS indicator is turned OFF during the following ignition cycle unless the fault is detected during that ignition cycle. However, the setting of a wheel speed sensor related DTC may cause the ABS indicator to remain illuminated during the following ignition cycle until the vehicle is operated at a speed greater than 13 km/h (8 mph) or, occasionally, 64 km/h (40 mph), depending on which DTC sets. This allows the EBCM to verify that no malfunction exists, before turning OFF the ABS indicator. It is important to verify that United Nations Economic Commission for Europe regulation number 13 (ECE 13) is not the cause of an ABS indicator which is illuminated when no DTCs are set, before attempting to diagnose other possible causes.

DIAGNOSTIC INFORMATION AND PROCEDURES

BRAKE ROTOR THICKNESS MEASUREMENT

Special Tools

CH-230-A Disc Gauge

Equivalent regional tools: [Special Tools](#)

WARNING: Refer to [Brake Dust Warning](#) .

Fig. 1: Disc Gauge On Brake Rotor

Courtesy of GENERAL MOTORS COMPANY

1. If the inboard friction surface of the brake rotor is not accessible, remove the brake pads. Refer to [Front Disc Brake Pads Replacement](#), and/or [Rear Disc Brake Pads Replacement](#), if equipped.
2. Clean the friction surfaces of the brake rotor with denatured alcohol, or an equivalent approved brake cleaner.

NOTE: Ensure the measurements are only taken within the friction surfaces.

3. Install the CH-230-A gauge for lateral runout measurement.
 1. Measure and record the thickness of the brake rotor at 4 or more points from the brake rotor inside to

outside.

2. Compare the lowest thickness measurement to the disc brake component specifications. Refer to [Disc Brake Component Specifications](#).
4. If the lowest thickness measurement of the brake rotor is above the minimum allowable thickness after refinishing specification, the rotor may be able to be refinished, depending upon surface and wear conditions which may be present.
5. If the lowest thickness measurement of the brake rotor is at or below the minimum allowable thickness after refinishing specification, the rotor may not be refinished.
6. If the lowest thickness measurement of the brake rotor is at or below the discard thickness specification, the rotor requires replacement. Refer to [Front Brake Rotor Replacement](#), and/or [Rear Brake Rotor Replacement](#).

BRAKE ROTOR THICKNESS VARIATION MEASUREMENT

Special Tools

CH-45101 Hub and Wheel Runout Gauge

For equivalent regional tools, refer to [Special Tools](#).

WARNING: Refer to [Brake Dust Warning](#) .

NOTE: Any disc brake rotor that exhibits thickness variation exceeding the maximum acceptable level must be refinished or replaced. Thickness variation exceeding the maximum acceptable level can cause brake pulsation.

1. If the inboard friction surface of the brake rotor is not accessible, remove the brake pads. Refer to [Front Disc Brake Pads Replacement](#), and/or [Rear Disc Brake Pads Replacement](#), if equipped.
2. Clean the friction surfaces of the brake rotor with denatured alcohol, or an equivalent approved brake cleaner.

Fig. 2: Mounting Dial Indicator To Measure Lateral Runout
Courtesy of GENERAL MOTORS COMPANY

NOTE: Ensure the measurements are only taken within the friction surfaces.

3. Install the CH-45101 runout gauge for lateral runout measurement and compare with the correct specifications. Refer to [Disc Brake Component Specifications](#).

NOTE: Whenever a brake rotor is refinished or replaced, the assembled lateral runout (LRO) of the rotor must be measured to ensure optimum performance of the disc brakes.

4. If the brake rotor lateral runout measurement exceeds the specification, the rotor requires refinishing or replacement. Refer to [Front Brake Rotor Replacement](#), [Rear Brake Rotor Replacement](#), or [Brake Rotor Refinishing](#).

BRAKE ROTOR SURFACE AND WEAR INSPECTION

WARNING: Refer to [Brake Dust Warning](#) .

1. If the inboard friction surface of the brake rotor is not accessible, remove the brake pads. Refer to [Front Disc Brake Pads Replacement](#), or/and [Rear Disc Brake Pads Replacement](#).

2. Clean the friction surfaces of the brake rotor with denatured alcohol, or an equivalent approved brake cleaner.
3. Inspect the friction surfaces of the brake rotor for the following Braking Surface Conditions:
 - Heavy rust and/or pitting.
 - Light surface rust can be removed with an abrasive disc. Heavy surface rust and/or pitting must be removed by refinishing the rotor. Refer to [Brake Rotor Refinishing](#).
 - Cracks and/or heat spots.
 - Excessive bluing discoloration.
4. If the friction surfaces of the brake rotor exhibit one or more of the Braking Surface Conditions, the rotor requires refinishing or replacement. Refer to [Front Brake Rotor Replacement](#), [Rear Brake Rotor Replacement](#), or [Brake Rotor Refinishing](#).

BRAKE ROTOR ASSEMBLED LATERAL RUNOUT MEASUREMENT

Special Tools

- **CH-41013** Rotor Resurfacing Kit
- **CH-42450-A** Wheel Hub Resurfacing Kit
- **CH-45101** Hub and Wheel Runout Gauge
- **CH-45101-100** Conical Brake Rotor Washers

For equivalent regional tool, refer to [Special Tools](#).

WARNING: Refer to [Brake Dust Warning](#) .

NOTE:

- Brake rotor assembled lateral runout (LRO) exceeding the maximum allowable specification can cause thickness variation to develop in the brake rotor over time, usually between 4800 and 11300 km (3000 and 7000 mi).
- Brake rotor thickness variation **MUST** be checked **BEFORE** checking for assembled lateral runout (LRO). Thickness variation exceeding the maximum acceptable level can cause brake pulsation. Refer to [Brake Rotor Thickness Variation Measurement](#).

NOTE:

Whenever the brake rotor has been separated from the hub/axle flange, any rust or contaminants should be cleaned from the hub/axle flange and the brake rotor mating surfaces. Failure to do this may result in excessive assembled lateral runout (LRO) of the brake rotor, which could lead to brake pulsation.

1. Inspect the mating surface of the hub/axle flange and the brake rotor to ensure that there are no foreign particles, corrosion, rust, or debris remaining. If the wheel hub/axle flange and/or if the brake rotor mating surfaces exhibit these conditions, perform the following steps:
 1. Remove the brake rotor from the vehicle. Refer to [Front Brake Rotor Replacement](#), and/or [Rear Brake Rotor Replacement](#).
 2. Using the **CH-42450-A** resurfacing kit, thoroughly clean any rust or corrosion from the mating surface of the hub/axle flange.
 3. Using the **CH-41013** resurfacing kit, thoroughly clean any rust or corrosion from the mating surface of the brake rotor.

4. Clean the friction surfaces of the brake rotor with denatured alcohol, or an equivalent approved brake cleaner.
2. Install the rotor to the hub/axle flange.

Fig. 3: Conical Brake Rotor Washer And Lug Nut
Courtesy of GENERAL MOTORS COMPANY

3. Hold the rotor firmly in place against the hub/axle flange and install one of the **CH-45101-100** washers (1), and one lug nut (2) onto the upper-most wheel stud.
4. Continue to hold the rotor secure and tighten the lug nut firmly by hand.

Fig. 4: Conical Brake Rotor Washers And Lug Nuts

Courtesy of GENERAL MOTORS COMPANY

5. Install the remaining **CH-45101-100** washers (1) and lug nuts onto the wheel studs and tighten the nuts firmly by hand in a star-pattern.
6. Tighten the lug nuts in a star-pattern to specification, in order to properly secure the rotor. Refer to [Tire and Wheel Removal and Installation](#) .
7. If the brake rotor has been REFINISHED or REPLACED with a new rotor, proceed to step 13.
8. If the brake rotor meets the following criteria, proceed to step 9.
 - The rotor is within specifications and is being REUSED.
 - The rotor has NOT been refinished.
 - The rotor does NOT exhibit thickness variation exceeding the maximum allowable level.

Fig. 5: Measuring Brake Rotor Lateral Runout
Courtesy of GENERAL MOTORS COMPANY

9. Mount the **CH-45101** gauge (1) or equivalent, to the strut and position the indicator button so it contacts the brake rotor friction surface at a 90 degree angle, approximately 13 mm (0.5 in) from the outer edge of the rotor.
10. Measure and record the assembled LRO of the brake rotor.
 1. Rotate the rotor until the lowest reading is displayed on the indicator dial, then set the dial to zero.
 2. Rotate the rotor until the highest reading is displayed on the dial.
 3. Mark the location of the high spot relative to the nearest wheel stud, or studs.
 4. Measure and record the amount of LRO.
11. Compare the brake rotor assembled LRO to the disc brake component specifications. Refer to **Disc Brake Component Specifications**
12. If the brake rotor assembled LRO is within specifications, proceed to step 17.

If the brake rotor assembled LRO exceeds the specification, refinish the rotor to ensure true parallelism. Refer to **Brake Rotor Refinishing**. After refinishing the rotor, proceed to step 13.

13. Mount the **CH-45101** gauge (1) or equivalent, to the strut and position the indicator button so it contacts the

brake rotor friction surface at a 90 degree angle, approximately 13 mm (0.5 in) from the outer edge of the rotor.

14. Measure and record the assembled LRO of the brake rotor.

1. Rotate the rotor until the lowest reading is displayed on the indicator dial, then set the dial to zero.
2. Rotate the rotor until the highest reading is displayed on the dial.
3. Mark the location of the high spot relative to the nearest wheel stud, or studs.
4. Measure and record the amount of LRO.

15. Compare the brake rotor assembled LRO to the disc brake component specifications.

16. If the brake rotor assembled LRO measurement exceeds the specification, replace the brake rotors. Refer to [Front Brake Rotor Replacement](#), and/or [Rear Brake Rotor Replacement](#).

17. If the brake rotor assembled LRO measurement is within specification, install the brake caliper and depress the brake pedal several times to secure the rotor in place before removing the **CH-45101-100** washers.

BRAKE PAD INSPECTION

Special Tools

CH-230-A Disc Gauge

For equivalent regional tools, refer to [Special Tools](#).

WARNING: Refer to [Brake Dust Warning](#) .

1. Remove brake pads. Refer to [Front Disc Brake Pads Replacement](#), and/or [Rear Disc Brake Pads Replacement](#).

Fig. 6: Measuring Brake Pad Thickness

Courtesy of GENERAL MOTORS COMPANY

2. Measure remaining brake pad thickness at several points, using the **CH-230-A** disc gauge (1).
3. Compare brake pad thickness to disc brake component specifications.

BRAKE CALIPER INSPECTION

Fig. 7: Brake Caliper Components

Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to [Brake Dust Warning](#) .

1. Inspect the brake caliper housing (1) for cracks, excess wear, and/or damage. If any of these conditions are present, the brake caliper requires replacement.
2. Inspect the caliper piston dust boot seal (2) for cracks, tears, cuts, deterioration and/or improper seating in the caliper body. If any of these conditions are present, the brake caliper requires overhaul or replacement.
3. Inspect for brake fluid leakage around the caliper piston dust boot seal (2) and on the disc brake pads. If there is any evidence of brake fluid leakage, the brake caliper requires overhaul or replacement.

Fig. 8: Compressing Caliper Piston

Courtesy of GENERAL MOTORS COMPANY

4. Inspect for smooth and complete travel of the caliper pistons into the caliper bores:

The movement of the caliper pistons into the caliper bores should be smooth and even. If the caliper piston is frozen or difficult to bottom, the caliper requires overhaul or replacement.

- For single piston caliper applications, insert a discarded inner brake pad (2) or block of wood in front of the piston. Using a large C-clamp (1) installed over the body of the caliper (3) and against the brake pad or block of wood, slowly bottom the piston in the bore.
- For dual piston caliper applications, insert a discarded inner brake pad (2) or block of wood in front of the pistons. Using 2 large C-clamps (1) installed over the body of the caliper (3) and against the brake pad or block of wood, slowly bottom the pistons evenly into the bores.

FRONT DISC BRAKE MOUNTING AND HARDWARE INSPECTION

WARNING: Refer to [Brake Dust Warning](#) .

Fig. 9: Exploded View Of Brake Pads And Brake Caliper Mounting Bracket
Courtesy of GENERAL MOTORS COMPANY

1. Inspect the fluid level in the brake master cylinder reservoir.
2. If the brake fluid level is midway between the maximum-full point and the minimum allowable level then no brake fluid needs to be removed from the reservoir before proceeding.
3. If the brake fluid level is higher than midway between the maximum-full point and the minimum allowable level then remove brake fluid to the midway point before proceeding.
4. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
5. Remove the tire and wheel assembly. Refer to [Tire and Wheel Removal and Installation](#) .
6. Grasp the brake caliper housing and try to move the brake caliper housing up/down and forward/reverse in relation to the brake caliper mounting bracket (3). If excessive looseness is observed the brake caliper bracket bushings and/or the brake caliper mounting bolts may need to be replaced. Compress the front caliper pistons
7. Compress the front caliper pistons.
 1. Install a large C-clamp over the top of the caliper housing and against the back of the outboard pad (1).
 2. Slowly tighten the C-clamp until the pistons are pushed completely into the caliper bores.
 3. Remove the C-clamp from the caliper.
8. With the pistons compressed into the caliper bores, grasp the brake caliper housing and slide it back and forth

on the brake caliper mounting bolts. Check for smooth operation. If the brake caliper housing slide force is high or the brake caliper housing does not slide smoothly, inspect the brake caliper mounting bolts and/or the brake caliper mounting bracket bushings for wear or damage. If wear or damage conditions are found, replacement of the brake caliper mounting bolts and/or the brake caliper mounting bracket bushings is necessary.

9. Remove the brake caliper mounting bolts from the brake caliper mounting bracket and support the brake caliper using heavy mechanics wire. Do Not remove the hydraulic brake hose from the caliper. Refer to [Front Brake Caliper Replacement](#).
10. Remove the disc brake pads (1, 2) from the brake caliper mounting bracket (3).
11. Inspect the disc brake pad mounting hardware for the following:
 - Missing mounting hardware.
 - Excessive corrosion.
 - Bent pad retainer spring (2).
 - Looseness at the brake caliper mounting bracket (3).
 - Looseness at the disc brake pads (1, 4).
 - Excessive contaminants in the brake caliper mounting bracket (3) surface and threads.
12. If any of the conditions listed are found, the disc brake pad mounting hardware requires replacement.
13. Ensure the disc brake pads are held firmly in place on the brake caliper mounting bracket, yet slide easily on the mounting hardware without binding.

Fig. 10: Caliper, Guide Pin Bolt, Caliper Mounting Bracket And Guide Pin Seal/Boot
Courtesy of GENERAL MOTORS COMPANY

14. Inspect the brake caliper mounting hardware for the following:

- Binding
- Seizing
- Looseness in the brake caliper mounting bracket (3).
- Bent or damaged brake caliper mounting bolts (1).
- Cracked or torn boots (4).
- Missing boots.
- Bent or damaged brake caliper mounting bracket (3).
- Cracked or damaged brake caliper (2).

15. If any of the conditions listed are found then the brake caliper mounting hardware requires replacement.

16. Install the disc brake pads to the brake caliper mounting bracket.

17. Install the disc brake caliper to the brake caliper mounting bracket. Refer to [Front Brake Caliper Replacement](#).

REAR DISC BRAKE MOUNTING AND HARDWARE INSPECTION

WARNING: Brake Dust Warning

1. Remove Rear Brake Caliper Bracket. Refer to Rear Brake Caliper Bracket Replacement

Fig. 11: Exploded View Of Brake Pads And Brake Caliper Mounting Bracket

Courtesy of GENERAL MOTORS COMPANY

2. Remove the disc brake caliper from the caliper mounting bracket (2).
3. Remove the disc brake pads (1) from the caliper mounting bracket (2).
4. Inspect the disc brake pad mounting hardware (3) (if installed) for the following:
 - Missing mounting hardware.
 - Excessive corrosion.
 - Brake pad fastener spring is bent.
 - Looseness at the brake caliper mounting bracket.
 - Looseness at the disc brake pads.
 - Excessive contaminants in the brake caliper mounting bracket surface and threads.
5. If any of the conditions listed are found, the disc brake pad mounting hardware requires replacement.
6. Ensure the disc brake pads are held firmly on the brake caliper mounting bracket, yet slide easily on the

mounting hardware without binding.

Fig. 12: Brake Caliper Mounting Bracket And Components
Courtesy of GENERAL MOTORS COMPANY

7. Inspect the brake caliper mounting hardware for the following:

- Binding
- Seizing
- Looseness in the brake caliper mounting bracket (1)
- Bent or damaged brake caliper mounting bolts
- Cracked or torn boots (4)
- Missing boots
- Bent or damaged brake caliper mounting bracket (3)
- Cracked or damaged brake caliper (2)

8. If any of the conditions listed are found then the brake caliper mounting hardware requires replacement.

9. Install the disc brake pads to the caliper mounting bracket.

10. Install the disc brake caliper to the mounting bracket.

11. Install Rear Brake Caliper Bracket. Refer to [Rear Brake Caliper Bracket Replacement](#)

REPAIR INSTRUCTIONS

FRONT DISC BRAKE PADS REPLACEMENT

Removal Procedure

WARNING: Refer to [Brake Dust Warning](#) .

WARNING: Refer to [Brake Fluid Irritant Warning](#) .

WARNING: Refer to [Torque-to-Yield Fastener Warning](#) .

NOTE: Always replace disc brake pads in axle sets.

1. Inspect the fluid level in the brake master cylinder reservoir.
2. If the brake fluid level is midway between the maximum-full point and the minimum allowable level, no brake fluid needs to be removed before proceeding.
3. If the brake fluid level is higher than midway between the maximum-full point and the minimum allowable level, remove brake fluid to the midway point before proceeding.
4. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#)
5. Remove the tire and wheel assembly. Refer to [Tire and Wheel Removal and Installation](#)
6. Place a large C-clamp over the brake caliper body and against the outer brake pad.
7. Using the C-clamp, carefully compress the brake caliper piston fully into the brake caliper bore.

Fig. 13: Brake Caliper Guide Pin Bolt

Courtesy of GENERAL MOTORS COMPANY

NOTE:

- DO NOT use any air tools to remove or install the guide pin bolts. Use hand tools ONLY.
- Install an open end wrench to hold the caliper guide pin in line with the

brake caliper while removing or installing caliper guide pin bolt. **DO NOT** allow the open end wrench to come in contact with the brake caliper. Allowing the open end wrench to come in contact with the brake caliper will cause a pulsation when the brakes are applied.

8. Remove and DISCARD Brake Caliper Guide Pin Bolt (1)

Fig. 14: Front Brake Caliper

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

9. Remove Front Brake Caliper (1)

10. Pivot the brake caliper upward and secure with heavy mechanics wire, or equivalent.

Fig. 15: Front Brake Caliper Springs

Courtesy of GENERAL MOTORS COMPANY

11. Remove Front Brake Caliper Springs (1) (Qty: 2)

Fig. 16: Inner Disc Brake Pad

Courtesy of GENERAL MOTORS COMPANY

12. Remove Inner Disc Brake Pad (1)

Fig. 17: Outer Disc Brake Pad

Courtesy of GENERAL MOTORS COMPANY

13. Remove Outer Disc Brake Pad (1)

Fig. 18: Front Disc Brake Pad Retaining Springs

Courtesy of GENERAL MOTORS COMPANY

14. Remove Front Disc Brake Pad Retaining Springs (1) (Qty: 2)
15. Thoroughly clean the disc brake pad retaining spring contact area and mating surfaces of the brake caliper bracket of any corrosion and debris.
16. Inspect the front brake caliper guide pins for freedom of movement and inspect the condition of the guide pin boots.

17. Move the brake caliper guide pins inboard and outboard within the brake caliper bracket guide pin bores, without disengaging the guide pins from the guide pin boots, and observe for the following conditions:
- Restricted brake caliper guide pin movement
 - Looseness in the brake caliper bracket guide pin bores
 - Seized or binding brake caliper guide pins
 - Split, torn, or otherwise damaged brake caliper guide pin boots
18. If any of the conditions listed are found, the brake caliper guide pins and/or brake caliper guide pin boots require replacement.

Installation Procedure

Fig. 19: Front Disc Brake Pad Retaining Springs
Courtesy of GENERAL MOTORS COMPANY

1. Install Front Disc Brake Pad Retaining Springs (1) (Qty: 2)

Fig. 20: Outer Disc Brake Pad

Courtesy of GENERAL MOTORS COMPANY

2. Install Outer Disc Brake Pad (1)

Fig. 21: Inner Disc Brake Pad

Courtesy of GENERAL MOTORS COMPANY

NOTE: The inner disc brake pad must be positioned with the wear sensor at the disc brake pad leading edge.

3. Install Inner Disc Brake Pad (1)

Fig. 22: Front Brake Caliper Springs

Courtesy of GENERAL MOTORS COMPANY

4. Install Front Brake Caliper Springs (1) (Qty: 2)

Fig. 23: Front Brake Caliper

Courtesy of GENERAL MOTORS COMPANY

CAUTION: The phenolic brake caliper piston can be damaged if it contacts the edges of the brake pads upon installation. To avoid phenolic brake caliper piston damage, carefully hold the brake pads against the rotor and do NOT allow the caliper piston to contact the edges of the brake pads while installing the caliper. If the brake caliper piston sustains any damage, the entire caliper will need to be replaced.

5. Install Front Brake Caliper (1)

Fig. 24: Brake Caliper Guide Pin Bolt

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Fastener Caution](#) .

NOTE: Install a NEW bolt.

6. Install and tighten NEW Brake Caliper Guide Pin Bolt (1) to 40 N.m (30 lb ft)
7. Install the tire and wheel assembly. Refer to [Tire and Wheel Removal and Installation](#)
8. With the engine OFF, gradually apply the brake pedal to approximately 2/3 of its travel distance.
9. Slowly release the brake pedal.
10. Wait 15 seconds, then repeat steps 9-10 until a firm brake pedal is obtained. This will properly seat the brake caliper pistons and brake pads.
11. Fill the brake master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container. Refer to [Master Cylinder Reservoir Filling](#)
12. Burnish the brake pads and rotors. Refer to [Brake Pad and Rotor Burnishing](#)

REAR DISC BRAKE PADS REPLACEMENT

Removal Procedure

WARNING: Refer to [Brake Dust Warning](#)

WARNING: Refer to [Brake Fluid Irritant Warning](#)

CAUTION: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#)

NOTE: Always replace disc brake pads in axle sets.

1. Inspect the fluid level in the brake master cylinder reservoir.
2. If the brake fluid level is midway between the maximum-full point and the minimum allowable level, no brake fluid needs to be removed before proceeding.
3. If the brake fluid level is higher than midway between the maximum-full point and the minimum allowable level, remove brake fluid to the midway point before proceeding.
4. Set the parking brake in service mode. With Scan Tool.
 1. Connect the scan tool.
 2. Ignition ON, engine OFF.
 3. Select Electronic Brake Control Module.
 4. Select Control Functions.

NOTE: Do not apply any brake pressure during the following step.

5. Select Rear Brake Caliper Piston Retract.
5. Turn OFF the ignition.

WARNING: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

6. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#)
7. Remove the rear tire and wheel assemblies. Refer to [Tire and Wheel Removal and Installation](#)

Fig. 25: Brake Caliper And Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

8. Disconnect Electrical Connector (1)
9. Remove Wiring Harness @ Brake Caliper (2)

Fig. 26: Brake Caliper And Guide Pin Bolt
 Courtesy of GENERAL MOTORS COMPANY

NOTE: Do NOT disconnect the brake hoses from the calipers.

- NOTE:**
- Do NOT use any air tools to remove or install the brake caliper guide pin bolts. Use hand tools ONLY.
 - Install an open end wrench to hold the caliper guide pin in line with the brake caliper while removing or installing the caliper guide pin bolt. Allowing the open end wrench to come in contact with the brake caliper will cause a pulsation when the brakes are applied.

10. Remove and DISCARD Brake Caliper Guide Pin Bolt (2)

Fig. 27: Rear Brake Caliper And Rear Disc Brake Pads
 Courtesy of GENERAL MOTORS COMPANY

CAUTION: Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible

brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

11. Without disconnecting the hydraulic brake flexible hose, pivot the rear brake caliper (2) downward and secure with heavy mechanics wire, or equivalent.
12. Remove Rear Disc Brake Pads (1) (Qty: 2)

Fig. 28: Rear Brake Caliper Bracket And Brake Pad Springs
Courtesy of GENERAL MOTORS COMPANY

NOTE: If installing NEW brake pads, DISCARD the springs.

13. Remove Brake Pad Springs (2) (Qty: 2) @ Brake Caliper Bracket (1)
14. Thoroughly clean the brake pad hardware mating surfaces of the caliper bracket of any debris and corrosion.
15. Inspect the rear brake caliper guide pins for freedom of movement and inspect the condition of the guide pin boots. Move the guide pins inboard and outboard within the bracket bores, without disengaging the slides from the boots, and observe for the following:
 - Restricted caliper guide pin movement
 - Looseness in the brake caliper mounting bracket
 - Seized or binding caliper guide pins
 - Split or torn boots.
16. If any of the conditions listed are found, the brake caliper guide pins and/or boots require replacement.

Installation Procedure

Fig. 29: Rear Brake Caliper Bracket And Brake Pad Springs

Courtesy of GENERAL MOTORS COMPANY

1. Ensure the brake pad hardware mating surfaces are clean.

NOTE: If installing new brake pads, install new brake pad springs.

2. Install Brake Pad Springs (2) (Qty: 2) @ Brake Caliper Bracket (1)

Fig. 30: Inner Brake Pad Nose And Piston Slot

Courtesy of GENERAL MOTORS COMPANY

3. Ensure the brake caliper piston slots are aligned vertically and the inner brake pad nose (2) fits into the piston slot (1).

Fig. 31: Rear Brake Caliper And Rear Disc Brake Pads

Courtesy of GENERAL MOTORS COMPANY

NOTE: The disc brake pad equipped with wear sensor has to be mounted in lower position on the inner side of the rotor.

4. Install Rear Disc Brake Pads (1) (Qty: 2) @ Rear Brake Caliper Bracket

NOTE: Do not rotate the brake caliper piston.

5. Push the brake caliper piston into the brake caliper housing. Use a suitable tool.

Fig. 32: Brake Caliper And Guide Pin Bolt

Courtesy of GENERAL MOTORS COMPANY

6. Remove the support, and rotate the rear brake caliper (1) into position over the disc brake pads and to the caliper mounting bracket.

WARNING: Refer to [Torque-to-Yield Fastener Warning](#)

CAUTION: Refer to [Fastener Caution](#)

NOTE: Install an open end wrench to hold the caliper guide pin in line with the brake caliper while removing or installing the caliper guide pin bolt.

7. Install the NEW upper rear brake caliper guide pin bolt (2) and tighten to 36 N.m (27 lb ft). Counter the hex flange on the rear brake caliper bracket using a suitable wrench.

Fig. 33: Brake Caliper And Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

8. Install Wiring Harness @ Brake Caliper (2)
9. Connect Electrical Connector (1)
10. Install the rear tire and wheel assemblies. Refer to [Tire and Wheel Removal and Installation](#)
11. With the engine OFF, gradually apply the brake pedal to approximately 2/3 of its travel distance.
12. Slowly release the brake pedal.
13. Wait 15 seconds, then gradually apply the brake pedal approximately 2/3 of its travel distance again until a firm brake pedal apply is obtained. This will properly seat the brake caliper pistons and brake pads.
14. Inspect the fluid level in the brake master cylinder reservoir.
15. Fill the brake master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container. Refer to [Master Cylinder Reservoir Filling](#)
16. Perform Parking Brake Calibration. Refer to [Park Brake Calibration](#)
17. Burnish the brake pads and rotors. Refer to [Brake Pad and Rotor Burnishing](#)

BRAKE PAD AND ROTOR BURNISHING

WARNING: Road test a vehicle under safe conditions and while obeying all traffic laws. Do not attempt any maneuvers that could jeopardize vehicle control. Failure to adhere to these precautions could lead to serious personal injury and vehicle damage.

Burnishing the brake pads and brake rotors is necessary in order to ensure that the braking surfaces are properly prepared after service has been performed on the disc brake system.

This procedure should be performed whenever the disc brake rotors have been refinished or replaced, and/or whenever the disc brake pads have been replaced.

1. Select a smooth road with little or no traffic.
2. Accelerate the vehicle to 48 km/h (30 mph).

NOTE: Use care to avoid overheating the brakes while performing this step.

3. Using moderate to firm pressure, apply the brakes to bring the vehicle to a stop. Do not allow the brakes to lock.
4. Repeat steps 2 and 3 until approximately 20 stops have been completed. Allow sufficient cooling periods between stops in order to properly burnish the brake pads and rotors.

FRONT BRAKE CALIPER REPLACEMENT

Removal Procedure

WARNING: Refer to [Brake Dust Warning](#)

WARNING: Refer to [Brake Fluid Irritant Warning](#)

WARNING: Use of eye goggles is necessary to prevent personal injury.

CAUTION: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#)

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the front tire and wheel assemblies. Refer to [Tire and Wheel Removal and Installation](#) .

Fig. 34: Brake Hose Fitting Bolt, Sealing Washers And Front Brake Caliper
Courtesy of GENERAL MOTORS COMPANY

3. Remove Brake Hose Fitting Bolt (1) @ Front Brake Caliper (3)
4. Remove Brake Hose @ Front Brake Caliper (3)
5. Cap the opening in the brake caliper and the brake hose to prevent fluid loss and contamination.
6. Remove and DISCARD Sealing Washer (2) @ Front Brake Caliper
7. Remove and DISCARD Sealing Washer (2) @ Brake Hose

Fig. 35: Brake Caliper Guide Pin Bolts And Front Brake Caliper
Courtesy of GENERAL MOTORS COMPANY

8. Remove Brake Caliper Guide Pin Bolts (1) (Qty: 2) @ Front Brake Caliper (2)
9. Remove Front Brake Caliper (2)

Fig. 36: Brake Caliper Guide Pins, Boots And Caliper Mounting Bracket
Courtesy of GENERAL MOTORS COMPANY

10. Inspect the brake caliper guide pins (1) for freedom of movement, and inspect the condition of the guide pin boots (2). Move the guide pins inboard and outboard within the bracket bores, without disengaging the slides from the boots, and observe for the following:
 - Restricted caliper guide pin movement
 - Looseness in the brake caliper mounting bracket
 - Seized or binding caliper guide pins
 - Split or torn boots
11. If a condition exists - Replace damaged components.

Installation Procedure

Fig. 37: Brake Caliper Guide Pin Bolts And Front Brake Caliper
Courtesy of GENERAL MOTORS COMPANY

1. Install Front Brake Caliper (2)

CAUTION: Fastener Caution

2. Install and tighten Brake Caliper Guide Pin Bolts (1) (Qty: 2) @ Front Brake Caliper (2) to 40 N.m (30 lb ft)

Fig. 38: Brake Hose Fitting Bolt, Sealing Washers And Front Brake Caliper
Courtesy of GENERAL MOTORS COMPANY

3. Install NEW Sealing Washers (2) (Qty: 2) Install a NEW seal.
4. Remove the caps from the brake caliper opening and the brake hose.
5. Install Brake Hose @ Front Brake Caliper (3)
6. Install and tighten Brake Hose Fitting Bolt (1) @ Front Brake Caliper (3) to 40 N.m (30 lb ft)
7. Bleed the brake system. Refer to [Hydraulic Brake System Bleeding](#)
8. Install the front tire and wheel assemblies. Refer to [Tire and Wheel Removal and Installation](#) .
9. Remove the support and lower the vehicle.
10. With the engine OFF, gradually apply the brake pedal to approximately 2/3 of its travel distance.
11. Slowly release the brake pedal.
12. Wait 15 seconds, then repeat step 11 and 12 until a firm brake pedal is obtained.

REAR BRAKE CALIPER REPLACEMENT

Removal Procedure

WARNING: Refer to [Brake Dust Warning](#)

WARNING: Refer to [Brake Fluid Irritant Warning](#)

WARNING: Use of eye goggles is necessary to prevent personal injury.

CAUTION: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#)

1. Set the parking brake in service mode.
 1. Connect the scan tool.
 2. Ignition ON, engine OFF.
 3. Select "Electronic Brake Control Module".
 4. Select "Control Functions".

NOTE: Do not apply any brake pressure during the following step.

5. Select "Rear Brake Caliper Piston Retract".
2. Turn OFF the ignition.
3. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#)
4. Remove the rear tire and wheel assemblies. Refer to [Tire and Wheel Removal and Installation](#)

Fig. 39: Brake Hose, Fitting Bolt And Sealing Washers
Courtesy of GENERAL MOTORS COMPANY

5. Remove Brake Hose Fitting Bolt (1) @ Rear Brake Caliper
6. Remove Brake Hose (2) @ Rear Brake Caliper
7. Cap the brake hose fitting to prevent brake fluid loss and contamination.
8. DISCARD the brake hose fitting gaskets. (3) (Qty: 2)

Fig. 40: Brake Caliper And Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

9. Disconnect the electrical connector (1) and remove the wiring harness from the brake caliper assembly (2).

Fig. 41: Rear Brake Caliper And Guide Pin Bolts
Courtesy of GENERAL MOTORS COMPANY

- 10. Remove Brake Caliper Guide Pin Bolts (2) (Qty: 2) @ Rear Brake Caliper (1)
- 11. Remove Rear Brake Caliper

Fig. 42: Brake Caliper Guide Pins, Boots And Caliper Mounting Bracket
Courtesy of GENERAL MOTORS COMPANY

12. Inspect the brake caliper guide pins (3) for freedom of movement, and inspect the condition of the guide pin boots (2). Move the guide pins inboard and outboard within the bracket bores, without disengaging the slides from the boots, and observe for the following:
 - Restricted caliper guide pin movement
 - Looseness in the brake caliper mounting bracket
 - Seized or binding caliper guide pins
 - Split or torn boots
13. If a condition exists - Replace damaged components.
14. Remove Rear Parking Brake Actuator. Refer to [Rear Parking Brake Actuator Replacement](#)

Installation Procedure

1. Install Rear Parking Brake Actuator. Refer to [Rear Parking Brake Actuator Replacement](#)

Fig. 43: Rear Brake Caliper And Guide Pin Bolts
Courtesy of GENERAL MOTORS COMPANY

2. Install Rear Brake Caliper (1)

CAUTION: Refer to [Fastener Caution](#)

NOTE: Do not rotate the brake caliper piston.

3. Install and tighten Brake Caliper Guide Pin Bolts (2) (Qty: 2) @ Rear Brake Caliper to 36 N.m (27 lb ft)

Fig. 44: Brake Caliper And Electrical Connector

Courtesy of GENERAL MOTORS COMPANY

4. Connect the electrical connector (1) and fix the wiring harness with 2 cable straps to the brake caliper assembly (2).

5. Remove the caps from the brake caliper opening and the brake hose.

Fig. 45: Brake Hose, Fitting Bolt And Sealing Washers

Courtesy of GENERAL MOTORS COMPANY

6. Install NEW brake hose fitting gaskets. (3) (Qty: 2)

7. Install and tighten Brake Hose Fitting Bolt (1) @ Rear Brake Caliper to 40 N.m (30 lb ft)

8. Bleed the brake system. Refer to [Hydraulic Brake System Bleeding](#)
9. Install the rear tire and wheel assemblies. Refer to [Tire and Wheel Removal and Installation](#) .
10. Remove the support and lower the vehicle.
11. With the engine OFF, gradually apply the brake pedal to approximately 2/3 of its travel distance.
12. Slowly release the brake pedal.
13. Wait 15 seconds, then repeat step 10 and 11 until a firm brake pedal is obtained.
14. Calibrate the park brake. Refer to [Park Brake Calibration](#) .

REAR BRAKE CALIPER GUIDE PIN REPLACEMENT

Removal Procedure

1. Remove the rear tire and wheel assemblies. Refer to [Tire and Wheel Removal and Installation](#)

Fig. 46: Brake Caliper And Guide Pin Bolts

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do NOT disconnect the brake hoses from the calipers.

CAUTION: Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

2. Remove Brake Caliper Guide Pin Bolts (2) (Qty: 2) @ Rear Brake Caliper (1)
3. Remove the brake caliper assembly and support with heavy mechanics wire.

Fig. 47: Brake Caliper Guide Pins, Boots And Caliper Mounting Bracket
Courtesy of GENERAL MOTORS COMPANY

4. Remove Rear Brake Caliper Guide Pins (3) (Qty: 2)

Installation Procedure

Fig. 48: Brake Caliper Guide Pins, Boots And Caliper Mounting Bracket
Courtesy of GENERAL MOTORS COMPANY

1. Apply a light coating of high temperature, silicone brake lubricant to the brake caliper bracket guide pin bores, the inner portion of the guide pin seals, and the brake caliper guide pins. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#)
2. Install Rear Brake Caliper Guide Pins (3) (Qty: 2)
3. Inspect the brake caliper guide pins (3) for free movement, and inspect the condition of the guide pin boots (2). Move the guide pins inboard and outboard within the bracket bores, without disengaging the slides from the boots, and observe for the following:
 - Restricted caliper guide pin movement
 - Looseness in the brake caliper mounting bracket
 - Seized or binding caliper guide pins

- Split or torn boots

Fig. 49: Brake Caliper And Guide Pin Bolts

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Fastener Caution](#)

4. Install and tighten Brake Caliper Guide Pin Bolts (2) (Qty: 2) @ Front Brake Caliper (1) to 36 N.m (27 lb ft)
5. Install the rear tire and wheel assemblies. Refer to [Tire and Wheel Removal and Installation](#)

FRONT BRAKE CALIPER OVERHAUL

Disassembly Procedure

WARNING: Refer to [Brake Dust Warning](#) .

WARNING: Refer to [Brake Fluid Irritant Warning](#) .

WARNING: Use of eye goggles is necessary to prevent personal injury.

WARNING: Do not place fingers in front of the caliper piston(s) in an attempt to catch or protect it when applying compressed air. The piston(s) can fly out with force and could result in serious bodily injury.

CAUTION: Use clean cloths to pad interior of caliper housing during piston removal. Use just enough air to ease the pistons out of the bores. If the pistons are blown out, even with the padding provided, it may be damaged.

1. Remove the brake caliper from the vehicle. Refer to [Front Brake Caliper Replacement](#).

Fig. 50: Using Low Pressure Compressed Air To Remove Brake Caliper Piston
Courtesy of GENERAL MOTORS COMPANY

Fig. 51: Exploded View Of Brake Caliper
Courtesy of GENERAL MOTORS COMPANY

2. Remove the brake caliper piston from the caliper bore by directing low pressure compressed air into the caliper (1) through the fluid inlet hole.
3. Remove the piston dust boot seal (1) from the seal counterbore in the caliper (4). Discard the boot seal.
4. Using a small wooden or plastic tool, remove the piston seal (3) from the caliper bore. Discard the piston seal.
5. Remove the bleeder valve cap (6).
6. Remove the bleeder valve (5).

NOTE: **Do not use abrasives to clean the brake caliper piston.**

7. If cracks, scoring, pitting, excessive rust, and/or excessive corrosion are present in the caliper bore, replace the caliper assembly.
8. If light rust or light corrosion are present in the caliper bore, attempt to remove the imperfection with a fine emery paper. If the imperfection cannot be removed, replace the caliper assembly.
9. Clean the brake caliper piston bore and seal counterbore, and the caliper piston with denatured alcohol, or equivalent.
10. Dry the caliper piston bore and counterbore, and the piston with non-lubricated, filtered, compressed air.

11. Inspect the caliper piston for cracks, scoring, and/or damage to the plating. Replace the caliper piston if any of these conditions exist.
12. Inspect the caliper mounting holes for cracks, scoring, pitting, rust and/or excessive corrosion. Replace the caliper assembly if any of these conditions exist.

Assembly Procedure

Fig. 52: Exploded View Of Brake Caliper
Courtesy of GENERAL MOTORS COMPANY

1. Lubricate the new piston seal (3) with brake fluid from a clean, sealed brake fluid container. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#) for the recommended brake fluid.
2. Install the lubricated, new piston seal into the caliper bore.

CAUTION: Refer to [Fastener Caution](#) .

3. Install the bleeder valve (5) to the caliper and tighten the valve to 10 N.m (88.508 lb in).
4. Install the bleeder valve cap (6).
5. Apply a thin coat of brake fluid from a clean, sealed brake fluid container to the brake caliper (4) bore. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#) for the recommended brake fluid.

Fig. 53: Caliper Piston And Caliper Piston Dust Boot Seal

Courtesy of GENERAL MOTORS COMPANY

6. Install the new piston dust boot seal (1) over the caliper piston.
7. Install the bottom half of the caliper piston (2) into the caliper bore.
8. Compress the caliper piston to the bottom of the caliper bore.
9. Fully seat the piston dust boot seal into caliper counterbore.
10. Install the brake caliper to the vehicle. Refer to [Front Brake Caliper Replacement](#).

REAR BRAKE CALIPER MOUNT PLATE REPLACEMENT

Special Tools

EN-45059 Angle Meter

Equivalent regional tools: [Special Tools](#)

Removal Procedure

1. Remove the rear tire and wheel assemblies. Refer to [Tire and Wheel Removal and Installation](#)

CAUTION: Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

2. Remove Rear Brake Rotor. Refer to [Rear Brake Rotor Replacement](#)
3. Remove Rear Wheel Speed Sensor. Refer to [Rear Wheel Speed Sensor Replacement](#)

Fig. 54: Rear Shock Absorber, Bolt And Hydraulic Lift
Courtesy of GENERAL MOTORS COMPANY

4. Support the rear axle with a hydraulic lift table. (3)
5. Remove Rear Shock Absorber Bolt (2)
6. Push up to the shock absorber (1) gain access to the rear wheel bearing and hub bolts.

Fig. 55: Rear Wheel Bearing And Hub Bolts

Courtesy of GENERAL MOTORS COMPANY

7. Remove Bolts (1) (Qty: 4)

Fig. 56: Rear Brake Caliper Mount Plate, Rear Brake Shield, Rear Wheel Bearing and Hub Assembly
Courtesy of GENERAL MOTORS COMPANY

8. Remove Rear Wheel Bearing and Hub Assembly (1)
9. Remove the rear brake shield (2).
10. Remove the rear brake caliper mount plate (3).

Installation Procedure

Fig. 57: Rear Brake Caliper Mount Plate, Rear Brake Shield, Rear Wheel Bearing and Hub Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Install the rear brake caliper mount plate (3).
2. Install the rear brake shield (2).
3. Install Rear Wheel Bearing and Hub Assembly (1)

Fig. 58: Rear Wheel Bearing And Hub Bolts

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution

4. Apply thread locking adhesive to the fasteners.
5. Install and tighten Bolts (1) (Qty: 4)
 1. First Pass: 50 N.m (37 lb ft).
 2. Final Pass: 30 - 45 degrees, use the **EN-45059** meter

Fig. 59: Rear Shock Absorber, Bolt And Hydraulic Lift

Courtesy of GENERAL MOTORS COMPANY

NOTE: Service may offer bolts without micro-encapsulated thread locking adhesive. If this is the case, apply thread locking adhesive to the bolt.

6. Support the rear axle with a tall jack stand near the shock absorber.
7. Install, but do NOT tighten Rear Shock Absorber Bolt (2)
8. Install Rear Wheel Speed Sensor. Refer to [Rear Wheel Speed Sensor Replacement](#)
9. Install Rear Brake Rotor. Refer to [Rear Brake Rotor Replacement](#)
10. Install Tire and Wheel. Refer to [Tire and Wheel Removal and Installation](#)
11. Lower the vehicle.

Fig. 60: Rear Shock Absorber Bolt

Courtesy of GENERAL MOTORS COMPANY

NOTE: Tighten the bolt with vehicle standing on the ground.

12. Tighten Rear Shock Absorber Bolt (1) to 100 N.m (74 lb ft)

FRONT BRAKE CALIPER HARDWARE REPLACEMENT

Removal Procedure

WARNING: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

WARNING: Refer to [Brake Dust Warning](#)

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#)
2. Remove the front tire and wheel assemblies. Refer to [Tire and Wheel Removal and Installation](#)

Fig. 61: Front Brake Caliper And Guide Pin Bolts

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do NOT disconnect the brake hoses from the calipers.

NOTE:

- Do NOT use any air tools to remove or install the brake caliper guide pin bolts. Use hand tools ONLY.
- Install an open end wrench to hold the caliper guide pin in line with the brake caliper while removing or installing the caliper guide pin bolt. Allowing the open end wrench to come in contact with the brake caliper will cause a pulsation when the brakes are applied.

3. Remove and DISCARD Brake Caliper Guide Pin Bolts (1) (Qty: 2) @ Front Brake Caliper (2)

CAUTION: Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

4. Remove Front Brake Caliper (2)

Fig. 62: Disc Brake Pads

Courtesy of GENERAL MOTORS COMPANY

5. Remove the disc brake pads. (1) (Qty: 2)

Fig. 63: Brake Caliper Guide Pins, Boots And Caliper Mounting Bracket

Courtesy of GENERAL MOTORS COMPANY

NOTE: The lower brake caliper guide pin is equipped with a bushing and must be installed in the same location.

6. Remove Front Brake Caliper Guide Pins (1) (Qty: 2) @ Front Brake Caliper Bracket (3)

Fig. 64: Brake Pad Springs And Caliper Bracket
Courtesy of GENERAL MOTORS COMPANY

7. Remove Brake Pad Springs (2) (Qty: 2) @ Brake Caliper Bracket (1)

Installation Procedure

Fig. 65: Brake Pad Springs And Caliper Bracket
Courtesy of GENERAL MOTORS COMPANY

1. Install Brake Pad Springs (2) (Qty: 2) @ Brake Caliper Bracket (1)

Fig. 66: Brake Caliper Guide Pins, Boots And Caliper Mounting Bracket
Courtesy of GENERAL MOTORS COMPANY

2. Seat the brake caliper guide pin seal in the groove of the brake caliper guide pin. (2)

NOTE: **The lower brake caliper guide pin is equipped with a bushing and must be installed in the same location.**

3. Install Front Brake Caliper Guide Pins (1) (Qty: 2) @ Front Brake Caliper Bracket (3)

4. Inspect the brake caliper guide pins (1) for freedom of movement, and inspect the condition of the guide pin boots (2). Move the guide pins inboard and outboard within the bracket bores, without disengaging the slides from the boots, and observe for the following:

- Restricted caliper guide pin movement
- Looseness in the brake caliper mounting bracket
- Seized or binding caliper guide pins
- Split or torn boots

5. Ensure the brake caliper guide pin seal is fully seated in the groove of the brake caliper guide pin and the guide pin slides freely in caliper bracket bore.

Fig. 67: Disc Brake Pads

Courtesy of GENERAL MOTORS COMPANY

6. Install the disc brake pads. (1) (Qty: 2)

Fig. 68: Rear Brake Caliper

Courtesy of GENERAL MOTORS COMPANY

7. Install Front Brake Caliper (2)

WARNING: Refer to [Torque-to-Yield Fastener Warning](#)

CAUTION: Refer to [Fastener Caution](#)

NOTE: Install an open end wrench to hold the caliper guide pin in line with the brake caliper while removing or installing the caliper guide pin bolt.

8. Install NEW Brake Caliper Guide Pin Bolts (1) (Qty: 2) @ Front Brake Caliper (2) and tighten to 40 N.m (30 lb ft). Install NEW bolts.
9. Install Tire and Wheel. Refer to [Tire and Wheel Removal and Installation](#)

REAR BRAKE CALIPER HARDWARE REPLACEMENT

Removal Procedure

WARNING: Do not use a service jack in locations other than those specified to lift this vehicle.

Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

WARNING: Refer to [Brake Dust Warning](#)

WARNING: Refer to [Brake Fluid Irritant Warning](#)

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#)
2. Remove the tire and wheel assembly. Refer to [Tire and Wheel Removal and Installation](#)

Fig. 69: Brake Caliper And Guide Pin Bolts

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do NOT disconnect the brake hoses from the calipers.

NOTE:

- Do NOT use any air tools to remove or install the brake caliper guide pin bolts. Use hand tools ONLY.
- Install an open end wrench to hold the caliper guide pin in line with the brake caliper while removing or installing the caliper guide pin bolt. Allowing the open end wrench to come in contact with the brake caliper will cause a pulsation when the brakes are applied.

3. Remove and DISCARD Brake Caliper Guide Pin Bolts (2) (Qty: 2) @ Rear Brake Caliper (1)

CAUTION: Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

4. Remove the brake caliper assembly and support with heavy mechanics wire.

Fig. 70: Disc Brake Pads

Courtesy of GENERAL MOTORS COMPANY

5. Remove the disc brake pads. (1) (Qty: 2)

Fig. 71: Brake Caliper Bracket And Brake Pad Springs

Courtesy of GENERAL MOTORS COMPANY

6. Remove Brake Pad Springs (1) (Qty: 2) @ Brake Caliper Bracket (2)

Fig. 72: Brake Caliper Guide Pins, Boots And Caliper Mounting Bracket
Courtesy of GENERAL MOTORS COMPANY

7. Seat the brake caliper guide pin seal in the groove of the brake caliper guide pin. (2) (Qty: 2)

NOTE: **The lower brake caliper guide pin is equipped with a bushing and must be installed in the same location.**

8. Install Rear Brake Caliper Guide Pins (3) (Qty: 2)

NOTE: **If reusing the brake caliper guide pins (3) and the guide pin seals (2). Inspect the brake caliper guide pins for freedom of movement, and inspect the condition of the guide pin boots. Move the guide pins inboard and outboard within the bracket bores, without disengaging the slides from the boots, and observe for the following:**

- Restricted caliper guide pin movement
- Looseness in the brake caliper mounting bracket
- Seized or binding caliper guide pins
- Split or torn boots

9. Ensure the brake caliper guide pin seal is fully seated in the groove of the brake caliper guide pin and the guide pin slides freely in caliper bracket bore.

Installation Procedure

Fig. 73: Brake Caliper Bracket And Brake Pad Springs

Courtesy of GENERAL MOTORS COMPANY

1. Install Brake Pad Springs (1) (Qty: 2) @ Brake Caliper Bracket (2)

Fig. 74: Disc Brake Pads

Courtesy of GENERAL MOTORS COMPANY

NOTE: The disc brake pad equipped with wear sensor has to be mounted in lower position on the inner side of the rotor.

2. Install the disc brake pads. (1) (Qty: 2)

Fig. 75: Brake Caliper And Guide Pin Bolts
Courtesy of GENERAL MOTORS COMPANY

3. Install the brake caliper. (1)

WARNING: Refer to [Torque-to-Yield Fastener Warning](#)

CAUTION: Refer to [Fastener Caution](#)

NOTE: Install an open end wrench to hold the caliper guide pin in line with the brake caliper while removing or installing the caliper guide pin bolt.

4. Install NEW Brake Caliper Guide Pin Bolts (2) (Qty: 2) @ Rear Brake Caliper (1) and tighten to 36 N.m (27 lb ft). Install NEW bolts.
5. Install the tire and wheel assembly. Refer to [Tire and Wheel Removal and Installation](#)
6. Remove the support and lower the vehicle.
7. With the engine OFF, gradually apply the brake pedal to approximately 2/3 of its travel distance.
8. Slowly release the brake pedal.
9. Wait 15 seconds, then gradually apply the brake pedal approximately 2/3 of its travel distance again until a firm brake pedal apply is obtained. This will properly seat the brake caliper pistons and brake pads.
10. Inspect the fluid level in the brake master cylinder reservoir.
11. Fill the brake master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container. Refer to [Master Cylinder Reservoir Filling](#)

FRONT BRAKE CALIPER BRACKET REPLACEMENT

Special Tools

EN-45059 Angle Meter

Equivalent regional tools: [Special Tools](#)

Removal Procedure

WARNING: Do not use a service jack in locations other than those specified to lift this

vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

WARNING: Refer to [Brake Dust Warning](#) .

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#)
2. Remove the front tire and wheel assemblies. Refer to [Tire and Wheel Removal and Installation](#)

Fig. 76: Front Brake Caliper And Guide Pin Bolts

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do NOT disconnect the brake hoses from the calipers.

- NOTE:**
- Do NOT use any air tools to remove or install the brake caliper guide pin bolts. Use hand tools ONLY.
 - Install an open end wrench to hold the caliper guide pin in line with the brake caliper while removing or installing the caliper guide pin bolt. Allowing the open end wrench to come in contact with the brake caliper will cause a pulsation when the brakes are applied.

3. Remove and DISCARD Brake Caliper Guide Pin Bolts (1) (Qty: 2) @ Front Brake Caliper (2)

CAUTION: Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

4. Remove Front Brake Caliper

Fig. 77: Disc Brake Pads

Courtesy of GENERAL MOTORS COMPANY

5. Remove the disc brake pads. (1) (Qty: 2)

7. Remove Bolts (1) (Qty: 2) @ Brake Caliper Bracket (2)
8. Remove Front Brake Caliper Bracket

Installation Procedure

Fig. 80: Brake Caliper Bracket And Bolts

Courtesy of GENERAL MOTORS COMPANY

1. Install Front Brake Caliper Bracket (2)

CAUTION: Refer to [Fastener Caution](#)

2. Install and tighten Bolts (1) (Qty: 2) @ Brake Caliper Bracket (2)
 1. First Pass: 150 N.m (111 lb ft).
 2. Final Pass: 15 - 30 degrees

Fig. 81: Brake Caliper Guide Pins, Boots And Caliper Mounting Bracket
Courtesy of GENERAL MOTORS COMPANY

3. Apply a light coating of high temperature, silicone brake lubricant to the brake caliper bracket guide pin bores, the inner portion of the guide pin seals, and the brake caliper guide pins.
4. Seat the brake caliper guide pin seal in the groove of the brake caliper guide pin. (2) (Qty: 2)

NOTE: The lower brake caliper guide pin is equipped with a bushing and must be installed in the same location.

5. Install Front Brake Caliper Guide Pins (1) (Qty: 2)
6. Ensure the brake caliper guide pin seal is fully seated in the groove of the brake caliper guide pin and the guide pin slides freely in caliper bracket bore.

NOTE: If reusing the brake caliper guide pins (1) and the guide pin seals (2). Inspect the brake caliper guide pins for freedom of movement, and inspect the condition of the guide pin boots. Move the guide pins inboard and outboard within the bracket bores, without disengaging the slides from the boots, and observe for the following:

- Restricted caliper guide pin movement
- Looseness in the brake caliper mounting bracket
- Seized or binding caliper guide pins
- Split or torn boots

Fig. 82: Brake Pad Springs And Caliper Bracket

Courtesy of GENERAL MOTORS COMPANY

7. Install Brake Pad Springs (2) (Qty: 2) @ Brake Caliper Bracket (1)

Fig. 83: Disc Brake Pads

Courtesy of GENERAL MOTORS COMPANY

NOTE: The disc brake pad equipped with wear sensor has to be mounted in upper position on the inner side of the rotor.

8. Install the disc brake pads. (1) (Qty: 2)

Fig. 84: Front Brake Caliper And Guide Pin Bolts
Courtesy of GENERAL MOTORS COMPANY

9. Install the brake caliper. (2)

WARNING: Refer to [Torque-to-Yield Fastener Warning](#)

NOTE: Install an open end wrench to hold the caliper guide pin in line with the brake caliper while removing or installing the caliper guide pin bolt.

10. Install and tighten Brake Caliper Guide Pin Bolts (1) (Qty: 2) @ Front Brake Caliper (2) to 40 N.m (30 lb ft)
11. Install the front tire and wheel assemblies. Refer to [Tire and Wheel Removal and Installation](#)
12. With the engine OFF, gradually apply the brake pedal to approximately 2/3 of its travel distance.
13. Slowly release the brake pedal.
14. Wait 15 seconds, then gradually apply the brake pedal approximately 2/3 of its travel distance again until a firm brake pedal apply is obtained. This will properly seat the brake caliper pistons and brake pads.
15. Inspect the fluid level in the brake master cylinder reservoir.
16. Fill the brake master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container. Refer to [Master Cylinder Reservoir Filling](#)

REAR BRAKE CALIPER BRACKET REPLACEMENT

Special Tools

EN-45059 Angle Meter

Equivalent regional tools: [Special Tools](#)

Removal Procedure

WARNING: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

WARNING: Refer to [Brake Dust Warning](#)

1. Set the parking brake in service mode

1. Change the transmission gear in neutral position.
2. Press the electronic park brake switch until the red parking brake status lamp is illuminating in the instrument cluster.

NOTE: Do not press the brake pedal intensely. It is sufficient when the brake lights are illuminated.

3. Press the brake pedal 5 times slightly until the vacuum in the power brake booster is empty.
4. Turn the ignition ON, with the engine OFF.
5. Press the brake pedal slightly and the electronic park brake switch for 15 seconds until the orange brake service lamp is illuminating.
6. By keeping brake pedal applied, release and re-press the electronic park brake switch for 5 seconds.
7. Release the electronic park brake switch and the brake pedal simultaneously. The rear brake calipers are retracting and the orange service brake lamp is flashing.

2. Turn OFF the ignition.

3. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#)

4. Remove the front tire and wheel assemblies. Refer to [Tire and Wheel Removal and Installation](#)

Fig. 85: Brake Caliper And Guide Pin Bolts

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do NOT disconnect the brake hoses from the calipers.

NOTE:

- Do NOT use any air tools to remove or install the brake caliper guide pin bolts. Use hand tools ONLY.
- Install an open end wrench to hold the caliper guide pin in line with the brake caliper while removing or installing the caliper guide pin bolt. Allowing the open end wrench to come in contact with the brake caliper will cause a pulsation when the brakes are applied.

5. Remove and DISCARD Brake Caliper Guide Pin Bolts (2) (Qty: 2) @ Rear Brake Caliper (1)

CAUTION: Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

6. Remove the brake caliper assembly.

Fig. 86: Disc Brake Pads

Courtesy of GENERAL MOTORS COMPANY

8. Remove Brake Pad Springs (1) (Qty: 2) @ Brake Caliper Bracket (2)

Fig. 88: Rear Brake Caliper Bracket And Bolts
Courtesy of GENERAL MOTORS COMPANY

9. Remove Bolts (2) (Qty: 2) @ Rear Brake Caliper Bracket (1)

10. Remove Rear Brake Caliper Bracket

Installation Procedure

Fig. 89: Rear Brake Caliper Bracket And Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install Rear Brake Caliper Bracket (1)

CAUTION: Refer to [Fastener Caution](#)

2. Install and tighten Bolts (2) (Qty: 2) @ Brake Caliper Bracket
 1. First Pass: 100 N.m (74 lb ft).
 2. Final Pass: 15 - 30 degrees, using the **EN-45059** meter

Fig. 90: Brake Caliper Guide Pins, Boots And Caliper Mounting Bracket
Courtesy of GENERAL MOTORS COMPANY

3. Apply a light coating of high temperature, silicone brake lubricant to the brake caliper bracket guide pin bores, the inner portion of the guide pin seals, and the brake caliper guide pins.
4. Seat the brake caliper guide pin seal in the groove of the brake caliper guide pin. (2) (Qty: 2)

NOTE: The lower brake caliper guide pin is equipped with a bushing and must be installed in the same location.

5. Install Front Brake Caliper Guide Pins (1) (Qty: 2)
6. Ensure the brake caliper guide pin seal is fully seated in the groove of the brake caliper guide pin and the guide pin slides freely in caliper bracket bore.

NOTE: If reusing the brake caliper guide pins (3) and the guide pin seals (2). Inspect the brake caliper guide pins for freedom of movement, and inspect the condition of the guide pin boots. Move the guide pins inboard and outboard within the bracket bores, without disengaging the slides from the boots, and observe for the following:

- Restricted caliper guide pin movement
- Looseness in the brake caliper mounting bracket
- Seized or binding caliper guide pins
- Split or torn boots

Fig. 91: Brake Caliper Bracket And Brake Pad Springs
Courtesy of GENERAL MOTORS COMPANY

7. Install Brake Pad Springs (1) (Qty: 2) @ Brake Caliper Bracket (2)

Fig. 92: Disc Brake Pads

Courtesy of GENERAL MOTORS COMPANY

NOTE: The disc brake pad equipped with wear sensor has to be mounted in upper position on the inner side of the rotor.

8. Install the disc brake pads. (1) (Qty: 2)

Fig. 93: Brake Caliper And Guide Pin Bolts

Courtesy of GENERAL MOTORS COMPANY

9. Install the brake caliper assembly (1).

WARNING: Refer to [Torque-to-Yield Fastener Warning](#)

10. Install and tighten Brake Caliper Guide Pin Bolts (2) (Qty: 2) @ Rear Brake Caliper (1) to 36 N.m (27 lb ft)
11. Install the tire and wheel assembly. Refer to [Tire and Wheel Removal and Installation](#)
12. With the engine OFF, gradually apply the brake pedal to approximately 2/3 of its travel distance.
13. Slowly release the brake pedal.
14. Wait 15 seconds, then gradually apply the brake pedal approximately 2/3 of its travel distance again until a firm brake pedal apply is obtained. This will properly seat the brake caliper pistons and brake pads.
15. Inspect the fluid level in the brake master cylinder reservoir.
16. Fill the brake master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container. Refer to [Master Cylinder Reservoir Filling](#)
17. Activate the electronic parking brake.
 1. Turn the ignition ON, with the engine OFF.
 2. Press the brake pedal slightly and push the electronic parking brake switch for over 5 seconds. The orange service lamp goes off and the red parking brake status lamp is flashing a few times.

FRONT BRAKE ROTOR REPLACEMENT

Special Tools

- CH-41013 Rotor Resurfacing Kit

- CH-42450-A Wheel Hub Resurfacing Kit

For equivalent regional tools, refer to [Special Tools](#).

Removal Procedure

WARNING: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

WARNING: Refer to [Brake Dust Warning](#) .

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the tire and wheel assembly. Refer to [Tire and Wheel Removal and Installation](#) .

[Fig. 94: Brake Caliper Bracket Bolts](#)

Courtesy of GENERAL MOTORS COMPANY

3. Remove the brake caliper bracket bolts (1).

CAUTION: Support the brake caliper with heavy mechanic wire, or equivalent, whenever it

is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

4. Remove the brake caliper and bracket as an assembly and support with heavy mechanics wire or equivalent.

Fig. 95: Brake Rotor Bolt

Courtesy of GENERAL MOTORS COMPANY

5. Remove the brake rotor bolt (1).

Fig. 96: Brake Rotor

Courtesy of GENERAL MOTORS COMPANY

6. Remove the brake rotor (1).

Installation Procedure

1. If installing a new brake rotor, clean the friction surfaces of the brake rotor with denatured alcohol or equivalent.
2. Using the **CH-42450-A** Wheel Hub Resurfacing Kit, thoroughly clean any rust or corrosion from the mating surface of the hub/axle flange.
3. Using the **CH-41013** Rotor Resurfacing Kit, thoroughly clean any rust or corrosion from the mating surface of the rotor to the hub/axle flange.

Fig. 97: Brake Rotor

Courtesy of GENERAL MOTORS COMPANY

4. Install the brake rotor (1).

Fig. 98: Brake Rotor Bolt

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

5. Install the brake rotor bolt (1) and tighten to 9 N.m (80 lb in).
6. Position the brake caliper and bracket assembly over the brake rotor and to the steering knuckle.

Fig. 99: Brake Caliper Bracket Bolts

Courtesy of GENERAL MOTORS COMPANY

7. Install the brake caliper bracket bolts (1).

Tighten

1. First Pass: 150 N.m (111 lb ft)
2. Final Pass: **15-30 degrees**

8. Install the tire and wheel assembly. Refer to [Tire and Wheel Removal and Installation](#) .

9. Burnish the brake pads and rotors. Refer to [Brake Pad and Rotor Burnishing](#).

REAR BRAKE ROTOR REPLACEMENT

Special Tools

- **CH-41013** Rotor Resurfacing Kit
- **CH-42450-A** Wheel Hub Resurfacing Kit
- **CH-45059** Angle Meter

Equivalent regional tools: [Special Tools](#)

Removal Procedure

WARNING: Refer to [Brake Dust Warning](#)

NOTE: Always replace disc brake rotors in axle sets.

1. Set the electronic parking brake in the service mode.
 1. Change the transmission gear to Neutral position.
 2. Press the electronic park brake switch until the red parking brake status lamp is illuminating in the instrument cluster.
- NOTE:** Do not press the brake pedal intensely. It is sufficient if the brake tail lamps are illuminating.
3. Press the brake pedal 5 times slightly until the vacuum in the power brake booster is empty.
4. Turn the ignition ON, with the engine OFF.
5. Press the brake pedal and the electronic park brake switch for 15 seconds until the orange brake service lamp is illuminating.
6. By keeping brake pedal applied, release and re-press the electronic park brake switch for 5 seconds.
7. Release the electronic park brake switch and the brake pedal simultaneously. The rear brake calipers are retracting and the orange brake service lamp is flashing.
2. Turn OFF the ignition.
3. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#)

WARNING: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

4. Remove the tire and wheel assembly. Refer to [Tire and Wheel Removal and Installation](#)

Fig. 100: Electrical Connector, Fasteners And Wiring Harness
Courtesy of GENERAL MOTORS COMPANY

5. Disconnect Electrical Connector (4)

6. Remove Fasteners (1) (Qty: 2)
7. Remove Fastener (2)
8. Remove Wiring Harness (3)

Fig. 101: Brake Caliper And Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

9. Remove Rear Brake Caliper Bracket Bolts (2) (Qty: 2)

CAUTION: Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

10. Remove the brake caliper assembly and support with heavy mechanics wire. (1)

Fig. 102: Rear Brake Rotor And Bolt
Courtesy of GENERAL MOTORS COMPANY

11. Remove Rear Brake Rotor Bolt (1)

12. Remove Rear Brake Rotor (2)

Installation Procedure

1. If installing a NEW brake rotor, clean the friction surfaces of the brake rotor with denatured alcohol.
2. Using the **CH-42450-A** resurfacing kit, thoroughly clean any rust or corrosion from the mating surface of the hub/axle flange.
3. Using the **CH-41013** resurfacing kit, thoroughly clean any rust or corrosion from the mating surface of the rotor to the hub/axle flange.

Fig. 103: Rear Brake Rotor And Bolt

Courtesy of GENERAL MOTORS COMPANY

4. Install Rear Brake Rotor (2)

CAUTION: Refer to [Fastener Caution](#)

5. Install and tighten Rear Brake Rotor Bolt (1) to 9 N.m (80 lb in)

Fig. 104: Brake Caliper And Bracket Bolts

Courtesy of GENERAL MOTORS COMPANY

6. Position the rear brake caliper assembly (1).
7. Install and tighten Rear Brake Caliper Bracket Bolts (2) (Qty: 2)
 1. First Pass: 100 N.m (74 lb ft)
 2. Final Pass: 15 - 30 degrees

Fig. 105: Electrical Connector, Fasteners And Wiring Harness
Courtesy of GENERAL MOTORS COMPANY

8. Install Wiring Harness (3)
9. Install Fastener (2)
10. Install Fasteners (1) (Qty: 2)
11. Connect Electrical Connector (4)
12. Install the tire and wheel assembly. Refer to [Tire and Wheel Removal and Installation](#)
13. Lower the vehicle.
14. Activate the electronic parking brake.
 1. Turn the ignition ON, with the engine OFF.
 2. Press the brake pedal and the electronic parking brake switch for over 5 seconds. The orange brake service lamp turns off and the red parking brake status lamp is flashing a few times.
15. Burnish the brake pads and rotors. Refer to [Brake Pad and Rotor Burnishing](#)

FRONT BRAKE SHIELD REPLACEMENT

Special Tools

EN-45059 Angle Meter

Equivalent regional tools: [Special Tools](#)

Removal Procedure

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove Front Wheel Bearing and Hub. Refer to [Front Wheel Bearing and Hub Replacement](#)

Fig. 106: Wheel Bearing/Hub, Front Brake Shield And Steering Knuckle
Courtesy of GENERAL MOTORS COMPANY

3. Remove the wheel bearing/hub (1) and front brake shield (2) from the steering knuckle.

Installation Procedure

Fig. 107: Wheel Bearing/Hub, Front Brake Shield And Steering Knuckle
Courtesy of GENERAL MOTORS COMPANY

1. Position the front brake shield (2) and wheel bearing/hub assembly (1) in the steering knuckle.
2. Install Front Wheel Bearing and Hub. Refer to [Front Wheel Bearing and Hub Replacement](#)
3. Remove the support and lower the vehicle.

REAR BRAKE SHIELD REPLACEMENT

Special Tools

EN-45059 Angle Meter

Equivalent regional tools: [Special Tools](#)

Removal Procedure

1. Remove the rear tire and wheel assemblies. Refer to [Tire and Wheel Removal and Installation](#)

CAUTION: Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible

brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

2. Remove Rear Brake Rotor. Refer to [Rear Brake Rotor Replacement](#)
3. Remove Rear Wheel Speed Sensor. Refer to [Rear Wheel Speed Sensor Replacement](#)

Fig. 108: Rear Shock Absorber, Bolt And Hydraulic Lift
Courtesy of GENERAL MOTORS COMPANY

4. Support the rear axle with a hydraulic lift table. (3)
5. Remove Rear Shock Absorber Bolt (2)
6. Push up to the shock absorber (1) gain access to the rear wheel bearing and hub bolts.

Fig. 109: Rear Wheel Bearing And Hub Bolts
Courtesy of GENERAL MOTORS COMPANY

7. Remove Bolts (1) (Qty: 4)

Fig. 110: Rear Brake Caliper Mount Plate, Rear Brake Shield, Rear Wheel Bearing and Hub Assembly
Courtesy of GENERAL MOTORS COMPANY

8. Remove Rear Wheel Bearing and Hub Assembly (1)
9. Remove the rear brake shield (2).
10. Remove the rear brake caliper mount plate (3).

Installation Procedure

Fig. 111: Rear Brake Caliper Mount Plate, Rear Brake Shield, Rear Wheel Bearing and Hub Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Install the rear brake caliper mount plate (3).
2. Install the rear brake shield (2).
3. Install Rear Wheel Bearing and Hub Assembly (1)

Fig. 112: Rear Wheel Bearing And Hub Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to **Fastener Caution**

4. Apply thread locking adhesive to the fasteners.
5. Install and tighten Bolts (1) (Qty: 4)
 1. First Pass: 50 Nm. (37 lb ft).
 2. Final Pass: 30 - 45 degrees, use the **EN-45059** meter

Fig. 113: Rear Shock Absorber, Bolt And Hydraulic Lift

Courtesy of GENERAL MOTORS COMPANY

NOTE: Service may offer bolts without micro-encapsulated thread locking adhesive. If this is the case, apply thread locking adhesive to the bolt.

6. Support the rear axle with a tall jack stand near the shock absorber.
7. Install, but do NOT tighten Rear Shock Absorber Bolt (2)
8. Install Rear Wheel Speed Sensor. Refer to [Rear Wheel Speed Sensor Replacement](#)
9. Install Rear Brake Rotor. Refer to [Rear Brake Rotor Replacement](#) - Install
10. Install Tire and Wheel. Refer to [Tire and Wheel Removal and Installation](#)
11. Lower the vehicle.

Fig. 114: Rear Shock Absorber Bolt

Courtesy of GENERAL MOTORS COMPANY

NOTE: Tighten the bolt with vehicle standing on the ground.

12. Tighten Rear Shock Absorber Bolt (1) to 100 N.m (74 lb ft)

BRAKE ROTOR ASSEMBLED LATERAL RUNOUT CORRECTION

NOTE:

- Brake rotor thickness variation **MUST** be checked **BEFORE** checking for assembled lateral runout (LRO). Thickness variation exceeding the maximum acceptable level can cause brake pulsation. Refer to [Brake Rotor Thickness Variation Measurement](#)
- Brake rotor assembled lateral runout (LRO) exceeding the maximum allowable specification can cause thickness variation to develop in the brake rotor over time, usually between 4800 - 11300 km (3,000 - 7,000 mi). Refer to [Brake Rotor Assembled Lateral Runout Measurement](#)

Review the following acceptable methods for bringing the brake rotor assembled LRO to within specifications. Determine which method to use for the specific vehicle being repaired.

- The indexing method of correcting assembled LRO is most effective when the LRO specification is only exceeded by a relatively small amount: 0.025 - 0.127 mm (0.001 - 0.005 in). Indexing is used to achieve the best possible match of high spots to low spots between related components. Refer to [Brake Rotor Assembled Lateral Runout Correction - Indexing](#)
- The on-vehicle brake lathe method is used to bring the LRO to within specifications through compensating for LRO while refinishing the brake rotor. Refer to [Brake Rotor Assembled Lateral Runout Correction - On Vehicle Lathe](#)

If the assembled LRO cannot be corrected using these methods, then other components must be suspected as causing and/or contributing to the LRO concern.

BRAKE ROTOR ASSEMBLED LATERAL RUNOUT CORRECTION - INDEXING

NOTE: This Procedure is not used in Europe

Special Tools

CH-45101-100 Conical Brake Rotor Washers

For equivalent regional tools, refer to [Special Tools](#).

Fig. 115: Conical Brake Rotor Washer And Lug Nut
 Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to [Brake Dust Warning](#) .

NOTE:

- Brake rotor thickness variation **MUST** be checked **BEFORE** checking for assembled lateral runout (LRO). Thickness variation exceeding the maximum acceptable level can cause brake pulsation. Refer to [Brake Rotor Thickness Variation Measurement](#)
- Brake rotor assembled LRO exceeding the maximum allowable specification can cause thickness variation to develop in the brake rotor over time, usually between 4800 - 11300 km (3,000 - 7,000 mi). Refer to [Brake Rotor Assembled Lateral Runout Measurement](#)

1. Remove the **CH-45101-100** Conical Brake Rotor Washers and the lug nuts that were installed during the assembled LRO measurement procedure.
2. Inspect the mating surface of the hub/axle flange and the brake rotor to ensure that there are no foreign particles or debris remaining.
3. Index the brake rotor in a different orientation to the hub/axle flange.
4. Hold the rotor firmly in place against the hub/axle flange and install one of the **CH-45101-100** Conical Brake Rotor Washers (1) and one lug nut (2) onto the upper-most wheel stud.
5. Continue to hold the rotor secure and tighten the lug nut firmly by hand.

Fig. 116: Conical Brake Rotor Washers And Lug Nuts

Courtesy of GENERAL MOTORS COMPANY

6. Install the remaining **CH-45101-100** Conical Brake Rotor Washers and lug nuts onto the wheel studs and tighten the nuts firmly by hand in a star-pattern.
7. Tighten the lug nuts in a star-pattern to specification, in order to properly secure the rotor. Refer to [**Tire and Wheel Removal and Installation**](#)
8. Measure the assembled LRO of the brake rotor. Refer to [**Brake Rotor Assembled Lateral Runout Measurement**](#)
9. Compare the amount of change between this measurement and the original measurement.
10. If this measurement is within specifications, proceed to step 14.
11. If this measurement still exceeds specifications, repeat steps 1 - 9 until the best assembled LRO measurement is obtained.
12. Matchmark the final location of the rotor to the wheel studs if the orientation is different than it was originally.
13. If the brake rotor assembled LRO measurement still exceeds the maximum allowable specification, refer to [**Brake Rotor Assembled Lateral Runout Correction**](#).
14. If the brake rotor assembled LRO is within specification, install the brake caliper and depress the brake pedal several times to secure the rotor in place before removing the **CH-45101-100** Conical Brake Rotor Washers and the lug nuts.

BRAKE ROTOR ASSEMBLED LATERAL RUNOUT CORRECTION - CORRECTION PLATES

NOTE: This procedure not used in Europe

Special Tools

CH-45101-100 Conical Brake Rotor Washers

For equivalent regional tools, refer to [**Special Tools**](#).

Fig. 117: Correction Plate, High Spot Mark And V-Shaped Notch

Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to [Brake Dust Warning](#) .

NOTE:

- Brake rotor thickness variation **MUST** be checked **BEFORE** checking for assembled lateral runout (LRO). Thickness variation exceeding the maximum acceptable level can cause brake pulsation. Refer to [Brake Rotor Thickness Variation Measurement](#)

- **Brake rotor assembled LRO exceeding the maximum allowable specification can cause thickness variation to develop in the brake rotor over time, usually between 4800 - 11300 km (3,000 - 7,000 mi). Refer to Brake Rotor Assembled Lateral Runout Measurement**

1. Rotate the brake rotor to position the high spot, identified and marked during the brake rotor assembled LRO measurement procedure, to face upward.
2. Remove the **CH-45101-100** Conical Brake Rotor Washers and the lug nuts that were installed during the assembled LRO measurement procedure and/or the indexing correction procedure.
3. Inspect the mounting surface of the hub/axle flange and the brake rotor to ensure that there are no foreign particles or debris remaining.
4. Select the correction plate, following the manufacturer's instructions, which has a specification closest to the assembled LRO measurement.

For example: If the assembled LRO measurement was 0.076 mm (0.003 in), the 0.076 mm (0.003 in) correction plate would be used. If the measurement was 0.127 mm (0.005 in), the 0.152 mm (0.006 in) correction plate would be used.

5. Determine the positioning for the correction plate (1) using the high spot mark (3) made during the brake rotor assembled LRO measurement procedure.

NOTE:

- **Do NOT install used correction plates in an attempt to correct brake rotor assembled LRO.**
- **Do NOT stack up, or install more than one correction plate onto one hub/axle flange location, in an attempt to correct brake rotor assembled LRO.**

6. Install the correction plate (1) onto the hub/axle flange, with the V-shaped notch (2) orientated to align with the high spot mark (3), that was positioned to face upward.

Fig. 118: Conical Brake Rotor Washer And Lug Nut
Courtesy of GENERAL MOTORS COMPANY

7. Install the brake rotor to the hub/axle flange. Use the matchmark made prior to removal for proper orientation to the flange.
8. Hold the rotor firmly in place against the hub/axle flange and install one of the **CH-45101-100** Conical Brake Rotor Washers (1) and one lug nut (2) onto the upper-most wheel stud.
9. Continue to hold the rotor secure and tighten the lug nut firmly by hand.

Fig. 119: Conical Brake Rotor Washers And Lug Nuts

Courtesy of GENERAL MOTORS COMPANY

10. Install the remaining **CH-45101-100** Conical Brake Rotor Washers and lug nuts onto the wheel studs and tighten the nuts firmly by hand in a star-pattern.
11. Tighten the lug nuts in a star-pattern to specification, in order to properly secure the rotor. Refer to [Tire and Wheel Removal and Installation](#)
12. Measure the assembled LRO of the brake rotor. Refer to [Brake Rotor Assembled Lateral Runout Measurement](#)
13. If the brake rotor assembled LRO measurement still exceeds the maximum allowable specification, refer to [Brake Rotor Assembled Lateral Runout Correction](#).
14. If the brake rotor assembled LRO measurement is within specification, install the brake caliper and depress the brake pedal several times to secure the rotor in place before removing the **CH-45101-100** Conical Brake Rotor Washers and the lug nuts.

BRAKE ROTOR ASSEMBLED LATERAL RUNOUT CORRECTION - ON VEHICLE LATHE

NOTE: This procedure is not used in Europe.

Special Tools

CH-45101-100 Conical Brake Rotor Washers

For equivalent regional tools, refer to [Special Tools](#).

WARNING: Refer to [Brake Dust Warning](#) .

NOTE:

- Brake rotor thickness variation **MUST** be checked **BEFORE** checking for assembled lateral runout (LRO). Thickness variation exceeding the maximum acceptable level can cause brake pulsation. Refer to [Brake Rotor Thickness Variation Measurement](#)
- Brake rotor assembled LRO exceeding the maximum allowable specification can cause thickness variation to develop in the brake rotor over time, usually between 4800 - 11300 km (3,000 - 7,000 mi). Refer to [Brake Rotor Assembled Lateral Runout Measurement](#)

1. Ensure that the caliper and caliper bracket that are already being supported, are clear from contacting any rotating components, such as the brake rotor.
2. Remove the **CH-45101-100** Conical Brake Rotor Washers and the lug nuts that were installed during the assembled LRO measurement procedure and/or the indexing correction procedure.
3. Inspect the mounting surface of the hub/axle flange and the brake rotor to ensure that there are no foreign particles or debris remaining.
4. Set up the lathe, following the manufacturer's instructions.
5. Refinish the brake rotor, following the brake lathe manufacturer's instructions.
6. After each successive cut, inspect the brake rotor thickness. Refer to [Brake Rotor Thickness Measurement](#)
7. If at any time the brake rotor exceeds the minimum allowable thickness after refinish specification, the brake rotor must be replaced. After replacing the rotor, proceed to step 10.
8. After refinishing the brake rotor, use the following procedure in order to obtain the desired non-directional finish:
 1. Follow the brake lathe manufacturer's recommended speed setting for applying a non-directional finish.
 2. Using moderate pressure, apply the non-directional finish:
 - If the lathe is equipped with a non-directional finishing tool, apply the finish with 120-grit aluminum oxide sandpaper.
 - If the lathe is not equipped with a non-directional finishing tool, apply the finish with a sanding block and 150-grit aluminum oxide sandpaper.
 3. After applying a non-directional finish, clean each friction surface of the brake rotor with denatured alcohol, or an equivalent approved brake cleaner.
9. Remove the lathe from the vehicle.
10. Measure the assembled LRO of the brake rotor. Refer to [Brake Rotor Assembled Lateral Runout Measurement](#)
11. If the brake rotor assembled LRO measurement still exceeds the maximum allowable specification, refer to [Brake Rotor Assembled Lateral Runout Correction](#).
12. If the brake rotor assembled LRO is within specification, install the brake caliper and depress the brake pedal several times to secure the rotor in place before removing the **CH-45101-100** Conical Brake Rotor Washers and the lug nuts.

BRAKE ROTOR REFINISHING

Special Tools

- **CH-41013** Rotor Resurfacing Kit
- **CH-42450-A** Wheel Hub Resurfacing Kit

For equivalent regional tools, refer to [Special Tools](#).

WARNING: Refer to [Brake Dust Warning](#) .

NOTE:

- The disc brake rotors do not require refinishing as part of routine brake system service. New disc brake rotors do not require refinishing.

Do not refinish disc brake rotors in an attempt to correct the following conditions:

- Brake system noise - squeal, growl, groan
- Uneven and/or premature disc brake pad wear
- Superficial or cosmetic corrosion/rust of the disc brake rotor friction surface
- Scoring of the disc brake rotor friction surface less than the maximum allowable specification
- Before refinishing a brake rotor, the rotor **MUST** first be checked for adequate thickness to allow the rotor to be refinished and remain above the minimum allowable thickness after refinish specification. Refer to [Brake Rotor Thickness Measurement](#)

Disc brake rotors should only be refinished if they have adequate thickness to be refinished and if one or more of the following conditions exist:

- Thickness variation in excess of the maximum allowable specification
- Excessive corrosion/rust and/or pitting
- Cracks and/or heat spots
- Excessive blueing discoloration
- Scoring of the disc brake rotor surface in excess of the maximum allowable specification
- Disc brake rotors may need to be refinished as part of the process for correcting brake rotor assembled lateral runout (LRO) that exceeds the maximum allowable specification.

NOTE:

If the vehicle is equipped with cross-drilled rotors, use a lathe with positive rake tooling. This setup requires less cutting pressure, which will result in less vibration, and a better surface finish. Also, use a vibration dampener when cutting. Otherwise, refinish according to the following instructions.

NOTE:

Whenever the brake rotor has been separated from the hub/axle flange, clean any rust or contaminants from the hub/axle flange and the brake rotor mating surfaces. Failure to do this may result in increased assembled lateral runout (LRO) of the brake rotor, which could lead to brake pulsation.

1. Using the **CH-42450-A** Wheel Hub Resurfacing Kit, thoroughly clean any rust or corrosion from the mating

surface of the hub/axle flange.

2. Using the **CH-41013** Rotor Resurfacing Kit, thoroughly clean any rust or corrosion from the mating surface and mounting surface of the brake rotor.
3. Inspect the mating surfaces of the hub/axle flange and the rotor to ensure that there are no foreign particles or debris remaining.
4. Mount the brake rotor to the brake lathe according to the lathe manufacturer's instructions, ensuring that all mounting attachments and adapters are clean and free of debris.
5. Ensure that any vibration dampening attachments are securely in place.
6. With the brake lathe running, slowly bring in the cutting tools until they just contact the brake rotor friction surfaces.
7. Observe the witness mark on the brake rotor. If the witness mark extends approximately three-quarters or more of the way around the brake rotor friction surface on each side, the brake rotor is properly mounted to the lathe.
8. If the witness mark does not extend three-quarters or more of the way around the brake rotor, re-mount the rotor to the lathe.
9. Following the brake lathe manufacturer's instructions, refinish the brake rotor.
10. After each successive cut, inspect the brake rotor thickness. Refer to [Brake Rotor Thickness Measurement](#)
11. If at any time the brake rotor exceeds the minimum allowable thickness after refinish specification, the brake rotor must be replaced.
12. After refinishing the brake rotor, use the following procedure in order to obtain the desired non-directional finish:
 1. Follow the brake lathe manufacturer's recommended speed setting for applying a non-directional finish.
 2. Using moderate pressure, apply the non-directional finish:
 - If the lathe is equipped with a non-directional finishing tool, apply the finish with 120-grit aluminum oxide sandpaper.
 - If the lathe is not equipped with a non-directional finishing tool, apply the finish with a sanding block and 150-grit aluminum oxide sandpaper.

NOTE: Thoroughly cleaning the brake rotor will prevent the possible transfer of finite metal dust left as a by-product of machining to the brake pad material during the burnishing process, thereby reducing the possibility for brake squeal or other brake noises to occur.

3. After applying a non-directional finish, clean each friction surface of the brake rotor with a solution of mild dish washing detergent and water, or a GM approved brake cleaner and a clean shop towel to remove metal particles remaining from machining. Repeat the cleaning process if necessary to remove all metal particles.
13. Remove the brake rotor from the brake lathe.
14. Measure the assembled LRO of the brake rotor to ensure optimum performance of the disc brakes. Refer to [Brake Rotor Assembled Lateral Runout Measurement](#)
15. If the brake rotor assembled LRO measurement exceeds the specification, bring the LRO to within specifications. Refer to [Brake Rotor Assembled Lateral Runout Correction](#)

DESCRIPTION AND OPERATION

DISC BRAKE SYSTEM DESCRIPTION AND OPERATION

Fig. 120: Brake Caliper Piston, Rotor And Brake Pads

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Brake Caliper Caution](#) .

The brake caliper is single piston type; and is installed on knuckle by two mounting bolts. Brake caliper transforms hydraulic pressure generated by depressing brake pedal into braking force. The braking force evenly acts on the piston (1) and the bottom of brake caliper cylinder bore, and then move the piston outward and slide brake caliper inward so that there generates a clamping effect on brake rotor (2). The clamping effect forces brake pad (3) to attach to brake rotor, and the resulting friction will make vehicles stop.

When maintaining the brake caliper, replace all parts included in repair sets.

- Lubricate the rubber parts with clean brake fluid to make assembly easier.
- Do not apply compressed air to brake parts with workshop with lubricant, otherwise the rubber parts may be damaged.
- If any hydraulic component is removed or disconnected, it may be necessary to bleed all or part of the brake system.
- Replace whole brake pad (3) according to service parts in the maintenance package.
- The torque values are specified for dry, non-lubricated fasteners.

- Perform the service operations on a clean bench, free from all mineral oil materials.

Gap Calibration

Fig. 121: Sectional View Of Pads, Piston Seal And Piston
Courtesy of GENERAL MOTORS COMPANY

When the hydraulic pressure acts on the piston (3), the piston moves left. The piston seals (2) exert pressure on the piston and move together with the cylinder. However, parts of the piston seals are fixed in the grooves of the cylinder. As shown, the shape of seals deforms toward the direction of piston.

When the pressure on the brake pedal is removed and the hydraulic pressure on the piston is released, there generates recovery elasticity on the seals. The force pushes the piston to the right side and return to its original position.

When the brake pad (1) exhibits wear, and the gap between the brake rotor and brake pad gets much larger, the piston moves farther.

Seals may further deform. Because the end of seals is fixed in the groove of the cylinder, the deformation is limited in the above-mentioned scope. Pistons further move to fill the gap. When the piston returns to the same position, the rubber seals resume original shape, and the gap between brake rotor and brake pad keeps the original level.

Circuit/System Verification

1. Ignition - On / Vehicle - In Service Mode
2. Verify DTC C0075 is not set.
 - **If the DTC is set**

Replace the component: K177 Brake Booster Control Module
 - **If the DTC is not set**
3. All OK.

Circuit/System Verification

1. Ignition - On / Vehicle - In Service Mode

2. Verify DTC C0075 is not set.

- **If the DTC is set**

1. Perform all necessary programming and setup procedures for the control module:K177 Brake Booster Control Module

2. Verify the DTC does not set.

- If the DTC sets - Replace the component:K177 Brake Booster Control Module

- If the DTC is not set

3. All OK.

- **If the DTC is not set**

3. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: [Diagnostic Repair Verification](#)

For control module replacement, programming, and setup refer to: [Control Module References](#)

Circuit/System Verification

1. Ignition/Vehicle - Off
2. Verify the condition does not exist: Incorrect fluid level or condition - Refer to: [Master Cylinder Reservoir Filling](#)
 - **If a condition exists**
Repair or replace as necessary.
 - **If no condition exists**

3. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the electrical connector: B20 Brake Fluid Level Switch
3. Test for less than 10 ohms between the test points: Ground circuit terminal 2 & Ground
 - **If 10 ohms or greater**
 1. Disconnect ground terminal.
 2. Test for less than 2 ohms between the test points: Ground circuit terminal 2 @ Component harness & The other end of the circuit @ Ground terminal
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
4. Ignition - On / Vehicle - In Service Mode
5. Verify the scan tool parameter: Brake Fluid Level Sensor = OK
 - **If not the specified state**
 1. Ignition/Vehicle - Off
 2. Disconnect the electrical connector: K17 Electronic Brake Control Module
 3. Test for infinite resistance between the test points: Signal circuit terminal 1 @ Component harness & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance - Replace the component: K17 Electronic Brake Control Module
 - **If the specified state**
6. Connect a 3 A fused jumper wire between the test points: Signal circuit terminal 1 & Ground
7. Verify the scan tool parameter: Brake Fluid Level Sensor = Low
 - **If not the specified state**
 1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
 2. Disconnect the electrical connector: K17 Electronic Brake Control Module
 3. Ignition - On / Vehicle - In Service Mode
 4. Test for less than 1 V between the test points: Signal circuit terminal 1 @ Component harness & Ground
 - If 1 V or greater - Repair the short to voltage on the circuit.
 - If less than 1 V
 5. Ignition/Vehicle - Off
 6. Test for less than 2 ohms between the test points: Signal circuit terminal 1 @ Component harness & The other end of the circuit @ Control module harness
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.

- If less than 2 ohms - Replace the component: K17 Electronic Brake Control Module
- **If the specified state**

8. Test or replace the component: B20 Brake Fluid Level Switch

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
5 V Reference	P057C, P05DD	P057C, P05DE	-	-
Brake Pedal Position Sensor Signal 1	P057C	P057C	P057D	P057B, P05E0
Brake Pedal Position Sensor Signal 2	P05DD	P05DE	P05DE	P05DC, P05E0
Low Reference	-	P057C, P05DE	-	-

Circuit/System Description

The brake booster system consists of a motor, electronic control unit (ECU), pedal travel sensor, and a master cylinder. The pedal travel sensor is connected to the brake pedal and measures the amount of brake pedal input to control the amount of boost needed. The pedal travel sensor consists of two travel sensors in one assembly, consisting of a shared 5 volt reference, shared low reference, and two signal circuits.

Conditions for Running the DTC

P057B, P057C, P057D, P057E, P05DC, P05DD, P05DE, P05DF, or P05E0

- Ignition ON/Vehicle in Service Mode.

Conditions for Setting the DTC

P057B

The brake pedal position sensor 1 upper and lower and lower range has been exceeded

P057E

Brake pedal position sensor 1 erratic signal

P057C

Brake pedal position sensor 1 signal shorted to ground

P057D

Brake pedal position sensor 1 signal shorted to voltage

P05DC

The brake pedal position sensor 2 upper and lower and lower range has been exceeded

P05DD

Brake pedal position sensor 2 signal shorted to ground

P05DE

Brake pedal position sensor 2 signal shorted to voltage

P05DF

Brake pedal position sensor 2 erratic signal

P05E0

The deviation between Brake pedal position sensor 1 and 2 is too large

Action Taken When the DTC Sets

P057B, P057C, P057D, P057E, P05DC, P05DD, P05DE, P05DF, or P05E0

- No boost or blending is available
- Red brake light and MIL are illuminated

Conditions for Clearing the DTC

P057B, P057C, P057D, P057E, P05DC, P05DD, P05DE, P05DF, or P05E0

The condition for setting the DTC is no longer present.

Diagnostic Aids

DTC P050E may set if the brake pedal is applied for 60 seconds or more while also applying the accelerator pedal.

Circuit/System Testing

1. Ignition OFF/Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B201 Brake Control Brake Pedal Position Sensor. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 3 and ground.
 - **If 10 Ω or greater**
 1. Disconnect the harness connector at the K177 Brake Booster Control Module.
 2. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K177 Brake Booster Control Module.
 - **If less than 10 Ω**
3. Ignition ON/Vehicle in Service Mode.
4. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 1 and ground.
 - **If less than 4.8 V**
 1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K177 Brake Booster Control Module.
 2. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the 5 V reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K177 Brake Booster Control Module.
 - **If greater than 5.2 V**
 1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K177 Brake Booster Control Module, Ignition ON/Vehicle in Service Mode.
 2. Test for less than 1 V between the 5 V reference circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K177 Brake Booster Control Module.
 - **If between 4.8 - 5.2 V**
5. Test for less than 1 V between the B201 Brake Control Brake Pedal Position Sensor signal circuit terminal 2 and ground.
- **If greater than 1 V**
 1. Ignition OFF/Ignition OFF/Vehicle OFF, disconnect the harness connector at the K177 Brake Booster Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K177 Brake Booster Control Module.
 - **If less than 1 V**
6. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K177 Brake Booster Control Module.
7. Test for infinite resistance between the B201 Brake Control Brake Pedal Position Sensor signal circuit terminal 2 and ground.
- **If less than infinite resistance**

Repair the short to ground on the circuit.
 - **If infinite resistance**
8. Test for less than 2 Ω in the B201 Brake Control Brake Pedal Position Sensor signal circuit end to end.
- **If 2 Ω or greater**

Repair the open/high resistance in the circuit.
 - **If less than 2 Ω**
9. Test for less than 1 V between the B201 Brake Control Brake Pedal Position Sensor signal circuit terminal 4 and ground.
- **If greater than 1 V**
 1. Ignition OFF/Ignition OFF/Vehicle OFF, disconnect the harness connector at the K177 Brake Booster Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K177 Brake Booster Control Module.
 - **If less than 1 V**
10. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K177 Brake Booster Control Module.
11. Test for infinite resistance between the B201 Brake Control Brake Pedal Position Sensor signal circuit terminal 4 and ground.
- **If less than infinite resistance**

Repair the short to ground on the circuit.
 - **If infinite resistance**

12. Test for less than 2 Ω in the B201 Brake Control Brake Pedal Position Sensor signal circuit end to end.

- **If 2 Ω or greater**

Repair the open/high resistance in the circuit.

- **If less than 2 Ω**

13. Replace the K177 Brake Booster Control Module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Control Module References](#) for control module replacement, programming and setup

DTC P0601, P0603, P0604, P0606, P060B, OR P062F: CONTROL MODULE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P0601

Control Module Read Only Memory Performance

DTC P0603

Control Module Long Term Memory Reset

DTC P0604

Control Module Random Access Memory Performance

DTC P0606

Control Module Processor Performance

DTC P060B

Control Module Analog to Digital Converter Performance

DTC P062F

Control Module Long Term Memory Performance

Circuit/System Description

For an overview of the component/system, refer to: [Hydraulic Brake System Description and Operation](#)

Conditions for Running the DTC

Ignition - On / Vehicle - In Service Mode

Conditions for Setting the DTC

K177 Brake Booster Control Module = Internal Malfunction

Actions Taken When the DTC Sets

Brake System Warning Indicator = ON

Conditions for Clearing the DTC

The conditions for setting the DTC no longer exist.

A history DTC will clear after 50 consecutive malfunction-free ignition cycles.

Circuit/System Verification

1. Ignition - On / Vehicle - In Service Mode
2. Verify DTC P0601, P0603, P0604, P0606, P060B, P062F is not set.
 - **If the DTC is set**
 1. Perform all necessary programming and setup procedures for the control module:K177 Brake Booster Control Module
 2. Verify the DTC does not set.
 - If the DTC sets - Replace the component:K177 Brake Booster Control Module
 - If the DTC is not set
3. All OK.

- If the DTC is not set

3. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: [Diagnostic Repair Verification](#)

For control module replacement, programming, and setup refer to: [Control Module References](#)

DTC P0642, P06A6, OR P06A7: SENSOR REFERENCE VOLTAGE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P0642

5 V Reference	P057C, P05DD, P06A6, P06A7	P057C, P05DE, P0642	-	P06A6, P06A7

Circuit/System Description

The brake booster system consists of a motor, electronic control unit (ECU), pedal travel sensor, and a master cylinder. The pedal travel sensor is attached to the brake pedal and measures the amount of brake pedal input to control the amount of boost needed. The pedal travel sensor consists of two travel sensors in one assembly, consisting of a shared 5 volt reference, shared low reference, and two signal circuits.

Conditions for Running the DTC

Ignition ON/Vehicle in Service Mode.

Conditions for Setting the DTC

Pedal travel sensor voltage supply failure

Action Taken When the DTC Sets

- No boost or blending available
- Red brake light and MIL are illuminated

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Control Module References for scan tool information

Circuit/System Testing

1. Ignition OFF/Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B201 Brake Control Brake Pedal Position Sensor. It may take up to 2 min for all vehicle systems to power down.
2. Ignition ON/Vehicle in Service Mode.
3. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 1 and ground.
 - **If less than 4.8 V**
 1. Ignition OFF/ignition OFF/Vehicle OFF, disconnect the harness connector at the K177 Brake Booster Control Module.
 2. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance

3. Test for less than 2 Ω in the 5 V reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K177 Brake Booster Control Module.
 - **If greater than 5.2 V**
1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K177 Brake Booster Control Module, Ignition ON/Vehicle in Service Mode.
2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K177 Brake Booster Control Module.
 - **If between 4.8 - 5.2 V**
4. Replace the K177 Brake Booster Control Module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Perform the Diagnostic Repair Verification after completing the repair: **Diagnostic Repair Verification**

For control module replacement, programming, and setup refer to: [Control Module References](#)

SYMPTOMS - HYDRAULIC BRAKES

IMPORTANT: The following steps must be completed before using the symptom tables.

1. Perform [Diagnostic System Check - Vehicle](#) before using the brake indicator symptom tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control module(s) can communicate via the serial data link.
2. Perform the [Brake System Vehicle Road Test](#) before using the hydraulic brake symptom tables in order to duplicate the customer's concern.
3. Review the system operation in order to familiarize yourself with the system functions.
 - [Power Brake Booster Description and Operation](#)
 - [Brake Warning System Description and Operation](#)
 - [Hydraulic Brake System Description and Operation](#)
 - [Disc Brake System Description and Operation](#)

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the brake warning system. [Checking Aftermarket Accessories](#)
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. [Testing for Intermittent Conditions and Poor Connections](#)

Symptom List

Perform a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [Brake Warning Indicator Malfunction](#)
- [Brake Pulsation](#)
- [Brake System Noise](#)
- [Braking Action Uneven - Pulls to One Side](#)
- [Braking Action Uneven - Front to Rear](#)
- [Brake Pedal Excessive Travel](#)
- [Brake Pedal Excessive Effort](#)
- [Brakes Drag](#)
- [Brake System Slow Release](#)
- [Brake Fluid Loss](#)

BRAKE WARNING INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC C1072

Brake Fluid Level Sensor Circuit

Symptom Byte Information: [Symptom Byte List](#)

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	C1072 05 C111C	C1072 05	C1072 05	-
Ground	-	C1072 05 C111C	-	-

Circuit/System Description

For an overview of the component/system, refer to: [Hydraulic Brake System Description and Operation](#)

Circuit	Description
Signal	The control module input circuit has an internal resistance connected to 12 V.
Ground	Chassis Ground

Component	Description
B20 Brake Fluid Level Switch	The brake fluid level switch is a normally open switch that closes when the brake fluid is below the minimum level. The switch is magnetically actuated by a float.
K17 Electronic Brake Control Module	The electronic brake control module detects a malfunction and sends a serial data message to the instrument cluster requesting illumination of the brake warning indicator.

Conditions for Running the DTC

Ignition - On / Vehicle - In Service Mode

Conditions for Setting the DTC

- Ground circuit = open

- Signal circuit = open/Short to Ground

Actions Taken When the DTC Sets

Brake System Warning Indicator = On

Conditions for Clearing the DTC

The conditions for setting the DTC no longer exist.

- **Wiring Repairs**

Scan Tool Reference

Control Module References

Circuit/System Verification

1. Ignition/Vehicle - Off
2. Verify the condition does not exist: Incorrect fluid level or condition - Refer to: **Master Cylinder Reservoir Filling**
 - **If a condition exists**

Repair or replace as necessary.
 - **If no condition exists**
3. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the electrical connector: B20 Brake Fluid Level Switch

3. Test for less than 10 ohms between the test points: Ground circuit terminal 2 & Ground
 - **If 10 ohms or greater**
 1. Disconnect ground terminal.
 2. Test for less than 2 ohms between the test points: Ground circuit terminal 2 @ Component harness & The other end of the circuit @ Ground terminal
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
4. Ignition - On / Vehicle - In Service Mode
5. Verify the scan tool parameter: Brake Fluid Level Sensor = OK
 - **If not the specified state**
 1. Ignition/Vehicle - Off
 2. Disconnect the electrical connector: K17 Electronic Brake Control Module
 3. Test for infinite resistance between the test points: Signal circuit terminal 1 @ Component harness & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance - Replace the component: K17 Electronic Brake Control Module
 - **If the specified state**
6. Connect a 3 A fused jumper wire between the test points: Signal circuit terminal 1 & Ground
7. Verify the scan tool parameter: Brake Fluid Level Sensor = Low
 - **If not the specified state**
 1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
 2. Disconnect the electrical connector: K17 Electronic Brake Control Module
 3. Ignition - On / Vehicle - In Service Mode
 4. Test for less than 1 V between the test points: Signal circuit terminal 1 @ Component harness & Ground
 - If 1 V or greater - Repair the short to voltage on the circuit.
 - If less than 1 V
 5. Ignition/Vehicle - Off
 6. Test for less than 2 ohms between the test points: Signal circuit terminal 1 @ Component harness & The other end of the circuit @ Control module harness
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Replace the component: K17 Electronic Brake Control Module
 - **If the specified state**
8. Test or replace the component: B20 Brake Fluid Level Switch

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: [Diagnostic Repair Verification](#)

- For control module replacement, programming, and setup refer to: [Control Module References](#)

BRAKE PULSATION

Step	Action	Yes	No
DEFINITION: Fluctuation or pulsation is felt through the brake pedal, steering wheel, seat, floor, and/or in the vehicle ONLY when braking.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to Symptoms - Hydraulic Brakes
2	1. Inspect the disc brake system for the following conditions. - Excessive thickness variation of rotor friction surfaces - Excessive assembled lateral runout (LRO) of rotor friction surfaces - Hard spots, heat checks, bluing discoloration of rotor friction surfaces; possibly due to brake drag - Excessive corrosion of rotor friction surfaces; including red, gray or black oxidation - Loose, damaged or missing caliper or lining hardware - Bent or damaged caliper or mounting component - Excessive LRO of wheel hub/axle flange; due to damage and/or loose or excessively worn bearings 2. Perform the disc brake system diagnostic procedure. Disc Brake System Diagnosis 3. Adjust, repair or replace components as necessary. Did you find and correct a condition?	Go to Step 3	Go to Symptoms - Hydraulic Brakes
3	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Brake System Vehicle Road Test Is the condition still present?	Go to Step 2	System OK

BRAKE SYSTEM NOISE

Step	Action	Yes	No
DEFINITION: Vehicle exhibits abnormal noise when braking; vehicle may exhibit abnormal noise during motion just after brake pedal release.			

Step	Action	Yes	No
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to <u>Diagnostic Starting Point - Vehicle</u>
2	1. Inspect the disc brake system for the following conditions. • Lining wear indicator contact with rotor • Debris trapped between rotor and splash shield or backing plate; and/or debris trapped between rotor and linings • Contaminated linings • Aftermarket linings • Glazed linings • Distorted, cracked or damaged linings • Excessively worn linings • Damaged or excessively worn caliper hardware and/or lining hardware • Incorrectly installed, loose or missing caliper hardware and/or lining hardware • Lack of lubrication or excessive corrosion on metal to metal contact surfaces • Bent or damaged splash shield or backing plate • Hard spots, heat checks, blueing discoloration of rotor friction surfaces • Glazed rotor friction surfaces • Bent or damaged caliper or mounting component 2. Adjust, repair or replace components as necessary. <u>Disc Brake System Diagnosis</u> Did you find and correct a condition?	Go to Step 6	Go to Step 3
3	1. Inspect the brake apply system for the following conditions. • Lack of lubrication or excessively worn pushrod or pedal pivots or pivot bushings • Bent or damaged pedal pushrod, pedal, or pedal bracket 2. Adjust, repair or replace components as necessary. <u>Hydraulic Brake System Diagnosis</u> Did you find and correct a condition?	Go to Step 6	Go to Step 4

Step	Action	Yes	No
4	1. Inspect the hydraulic brake system for the following conditions. • Improper operation of caliper pistons • Contaminated brake fluid 2. Adjust, repair or replace components as necessary. <u>Hydraulic Brake System Diagnosis</u> Did you find and correct a condition?	Go to Step 6	Go to Step 5
5	Inspect the park brake system for proper operation. <u>Park Brake System Diagnosis</u> Did you find and correct a condition?	Go to Step 6	Go to <u>Diagnostic Starting Point - Vehicle</u>
6	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. <u>Brake System Vehicle Road Test</u> Is the condition still present?	Go to Step 2	System OK

BRAKING ACTION UNEVEN - PULLS TO ONE SIDE

Test Description

The numbers below refer to the step numbers on the diagnostic table.

4

Suspension components that are not operating properly may cause a disturbance to the vehicle during application of the brake system.

5

Steering components that are not operating properly may cause a disturbance to the vehicle during application of the brake system.

Step	Action	Yes	No
DEFINITION: Vehicle pulls to one side only when braking.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to <u>Diagnostic Starting Point - Vehicle</u>
2	1. Inspect the hydraulic brake system for the following conditions. • Kinked, pinched or damaged brake pipe or flexible brake hose • Sticking or improperly operating caliper piston	Go to Step 6	Go to Step 3

Step	Action	Yes	No
	• Brake fluid leak 2. Adjust, repair or replace components as necessary. Hydraulic Brake System Diagnosis Did you find and correct a condition?		
3	1. Inspect the disc brake system for the following conditions. • Contaminated linings • Glazed linings • Distorted, cracked or damaged linings on one side • Loose, damaged or missing caliper hardware and/or lining hardware • Incorrect linings on one side • Hard spots, heat checks, blueing discoloration of rotor friction surfaces; possibly due to brake drag • Glazed rotor friction surfaces • Bent or damaged caliper or mounting component 2. Adjust, repair or replace components as necessary. Disc Brake System Diagnosis Did you find and correct a condition?	Go to Step 6	Go to Step 4
4	1. Inspect the suspension system for the following conditions. • Incorrect tire pressures • Loose suspension component connections • Excessively worn or damaged suspension components 2. Adjust, repair or replace components as necessary. Diagnostic Starting Point - Vehicle Did you find and correct a condition?	Go to Step 6	Go to Step 5
5	1. Inspect the steering system for the following conditions. • Loose steering component connections • Excessively worn or damaged steering components 2. Adjust, repair or replace components as necessary. Diagnostic Starting Point - Vehicle	Go to Step 6	Go to Diagnostic Starting Point - Vehicle

Step	Action	Yes	No
	Did you find and correct a condition?		
6	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. <u>Brake System Vehicle Road Test</u> Is the condition still present?	Go to Step 2	System OK

BRAKING ACTION UNEVEN - FRONT TO REAR

Test Descriptions

The number below refers to the step number on the diagnostic table.

4

Suspension components that are not operating properly may cause a disturbance to the vehicle during application of the brake system.

Step	Action	Yes	No
DEFINITION: Braking action or stopping force sensitive or grabbing and/or more pronounced at the front or at the rear axle. Sensitive or grabbing brakes: Excessive brake jump-in force relative to brake pedal input.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to <u>Diagnostic Starting Point - Vehicle</u>
2	1. Inspect the hydraulic brake system for the following conditions: • Improper operation of caliper pistons • Kinked, pinched or damaged brake pipe or flexible brake hose • Brake fluid leak • Improper operation of dynamic rear proportion (DRP) system 2. Adjust, repair or replace components as necessary. <u>Hydraulic Brake System Diagnosis</u> Did you find and correct a condition?	Go to Step 6	Go to Step 3
3	1. Inspect the disc brake system for the following conditions: • Contaminated linings • Glazed linings • Distorted, cracked or damaged linings • Excessively worn linings	Go to Step 6	Go to Step 4

Step	Action	Yes	No
	• Aftermarket linings • Damaged or excessively worn caliper hardware and/or lining hardware • Hard spots, heat checks, blueing discoloration of rotor friction surfaces • Glazed rotor friction surfaces 2. Adjust, repair or replace components as necessary. <u>Disc Brake System Diagnosis</u> Did you find and correct a condition?		
4	1. Inspect the suspension system for the following conditions: • Loose suspension component connections • Excessively worn or damaged suspension components 2. Adjust, repair or replace components as necessary. <u>Diagnostic Starting Point - Vehicle</u> Did you find and correct a condition?	Go to Step 6	Go to Step 5
5	1. Inspect the brake apply system for the following conditions: • Binding, bent or damaged pedal pushrod, pedal, or pedal bracket • Binding, bent or damaged brake pedal • Binding, bent or damaged brake pedal bracket 2. Adjust, repair or replace components as necessary. <u>Hydraulic Brake System Diagnosis</u> Did you find and correct a condition?	Go to Step 6	Go to <u>Diagnostic Starting Point - Vehicle</u>
6	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. <u>Brake System Vehicle Road Test</u> Is the condition still present?	Go to Step 2	System OK

BRAKE PEDAL EXCESSIVE TRAVEL

Step	Action	Yes	No
DEFINITION: Brake pedal travels further than expected to obtain firm pedal and/or firm pedal cannot be obtained, pedal fades away, or pedal is spongy.			

Step	Action	Yes	No
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to Symptoms - Hydraulic Brakes
2	Inspect the travel and feel of brake pedal applies. Perform the following: 1. Place the Power button in the Service Only mode. 2. Remove one of the Electric Brake Boost fuses from the Engine Compartment Fuse Block. 3. Apply the brake pedal with light, steady pressure and hold for 15 seconds. Observe pedal travel and feel. Did you complete the brake pedal travel and feel inspections?	Go to Step 3	-
3	1. Inspect the hydraulic brake system for the conditions listed, based on the following symptoms observed during the pedal travel and feel inspections: • Pedal feel was spongy • Air in hydraulic system • External brake fluid leaks • Soft, weak or damaged hydraulic hoses; expanding under pressure • Pedal fell away and/or traveled to or almost to floor • External brake fluid leaks • Poor brake fluid quality; low boiling point • Internal brake fluid leaks; improperly functioning master cylinder • Pedal was somewhat firm then dropped slightly, or pedal rose with successive applies, or pedal travel was different between slow and quick applies • Internal brake fluid leaks; improperly functioning master cylinder • Poor brake fluid quality; low boiling point • Pedal returned to rest slowly after any of the applies • Internally damaged flexible brake	Go to Step 9	Go to Step 4

Step	Action	Yes	No
	hoses; hindering fluid return • Binding caliper pistons • Internal brake fluid leaks; improperly functioning master cylinder 2. Repair or replace components as necessary. <u>Hydraulic Brake System Diagnosis</u> 3. Re-inspect brake pedal apply travel and feel. Did you find and correct a condition?		
4	1. Inspect the disc brake system for the following conditions: • Cracked, excessively worn or damaged linings • Cracked, excessively worn or damaged rotors • Improperly operating, binding or damaged caliper hardware and/or lining hardware • Loose or missing caliper hardware and/or lining hardware • Excessive assembled lateral runout (LRO) of rotor friction surfaces • Bent or damaged caliper or mounting component 2. Adjust, repair or replace components as necessary. <u>Disc Brake System Diagnosis</u> 3. Re-inspect brake pedal apply travel and feel. Did you find and correct a condition?	Go to Step 9	Go to Step 5
5	Inspect for proper brake pedal travel. <u>Brake Pedal Travel Measurement and Inspection</u> Is the brake pedal travel distance within the acceptable limits?	Go to Step 8	Go to Step 6

Step	Action	Yes	No
6	1. Inspect for worn, missing, misaligned, bent or damaged brake pedal system components. • Perform the brake pedal pushrod component inspection. Brake Pedal Pushrod Inspection. • Inspect the brake pedal bushings for binding, excessive wear and/or damage and inspect the brake pedal for a misaligned, bent, and/or damaged condition. 2. Replace the brake pedal system components that are worn, missing, misaligned, bent or damaged. Did you find and replace any worn, missing, misaligned, bent or damaged brake pedal system components?	Go to Step 9	Go to Step 7
7	1. Replace the brake master cylinder assembly. 2. Inspect the brake pedal travel. Brake Pedal Travel Measurement and Inspection Did you find and correct a condition?	Go to Step 9	Go to Step 8
8	1. Inspect the brake assist system for the following conditions: • Internal fluid leaks and/or restrictions within the brake modulator assembly • Damaged or improperly operating brake modulator assembly 2. Adjust, repair or replace components as necessary. Hydraulic Brake System Diagnosis Did you find and correct a condition?	Go to Step 9	Go to Symptoms - Hydraulic Brakes
9	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Brake System Vehicle Road Test Is the condition still present?	Go to Step 2	System OK

BRAKE PEDAL EXCESSIVE EFFORT

Step	Action	Yes	No
DEFINITION: Brake pedal requires an increased amount of input from the driver to obtain good braking action and/or stopping distance is increased.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to Diagnostic Starting Point -

Step	Action	Yes	No
			<u>Vehicle</u>
2	1. Inspect the brake assist system for the following conditions: • Lack of lubrication, binding or excessively worn pushrod or pedal pivots or pivot bushings • Bent or damaged pedal pushrod, pedal, or pedal bracket 2. Adjust, repair or replace components as necessary. <u>Hydraulic Brake System Diagnosis</u> Did you find and correct a condition?	Go to Step 5	Go to Step 3
3	1. Inspect the hydraulic brake system for the following conditions: • Binding caliper pistons • Internally damaged flexible brake hoses; hindering fluid flow • External brake fluid leaks • Kinked or damaged flexible brake hoses and/or pipes • Internal brake fluid leaks; improperly operating master cylinder • Poor brake fluid quality; low boiling point 2. Adjust, repair or replace components as necessary. <u>Hydraulic Brake System Diagnosis</u> Did you find and correct a condition?	Go to Step 5	Go to Step 4
4	1. Inspect the disc brake system for the following conditions: • Excessively worn linings • Glazed linings • Cracked, distorted or damaged linings • Contaminated linings • Binding, damaged or excessively worn caliper hardware and/or lining hardware • Lack of lubrication or excessive corrosion on metal to metal contact surfaces • Excessively worn or corroded rotor friction surfaces • Glazed rotor friction surfaces • Hard spots, heat checks, blueing	Go to Step 5	Go to <u>Diagnostic Starting Point - Vehicle</u>

Step	Action	Yes	No
	discoloration of rotor friction surfaces 2. Adjust, repair or replace components as necessary. <u>Disc Brake System Diagnosis</u> Did you find and correct a condition?		
5	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. <u>Brake System Vehicle Road Test</u> Is the condition still present?	Go to Step 2	System OK

BRAKES DRAG

Step	Action	Yes	No
DEFINITION: Brake system does not fully release or has delayed release; vehicle motion may be hindered by brake system without applying brakes.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to <u>Diagnostic Starting Point - Vehicle</u>
2	Is the vehicle equipped with an adjustable stop lamp switch and/or an adjustable cruise control release switch?	Go to Step 3	Go to Step 4
3	1. Inspect the stop lamp switch for proper adjustment to ensure that the brake pedal is fully releasing. 2. Inspect the cruise control release switch, if equipped, for proper adjustment to ensure that the brake pedal is fully releasing. Did you find and correct a condition?	Go to Step 14	Go to Step 4
4	Is the vehicle equipped with a drum-in-rotor type of park brake system?	Go to Step 5	Go to Step 7
5	Ensure the park brake shoes are not adjusted too tightly, possibly causing drag under certain conditions. Are the park brake shoes adjusted too tightly?	Go to Step 6	Go to Step 7
6	1. Clean and inspect the park brake shoes for excessive wear and/or damage. 2. Inspect the drum portion of the rotors for excessive wear, blueing discoloration and heat spots. 3. If any of these conditions are present, replace the affected components. 4. Adjust the park brake system.	Go to Step 14	Go to Step 7

Step	Action	Yes	No
	Did you find and correct a condition?		
7	Inspect the park brake system for proper operation. Park Brake System Diagnosis Did you find and correct a condition?	Go to Step 14	Go to Step 8
8	1. Inspect the disc brake system for the following conditions: • Binding, incorrectly installed or missing caliper hardware and/or lining hardware - Ensure free movement of linings and of caliper, if equipped with sliding type caliper • Lack of lubrication or excessive corrosion on metal to metal contact surfaces • Distorted or damaged linings • Damaged or excessively worn caliper hardware and/or lining hardware • Bent or damaged caliper or mounting component 2. Adjust, repair or replace components as necessary. Disc Brake System Diagnosis Did you find and correct a condition?	Go to Step 14	Go to Step 9
9	1. Separate the brake booster pushrod from the brake pedal. 2. Inspect the brake corners to determine if the brake drag condition is still present. Do the brake corners still exhibit the brake drag condition?	Go to Step 11	Go to Step 10
10	1. Inspect the pushrod for improper positioning and/or damage. Correctly position or replace the pushrod if necessary. 2. Inspect the brake pedal assembly for damage and replace if necessary. Did you complete the repair or replacement?	Go to Step 14	-
11	1. For vacuum boost systems, disconnect the vacuum check valve from the booster to relieve vacuum reserve. 2. Separate the master cylinder from the brake booster. Do not disconnect any brake pipes. 3. Inspect the brake corners to determine if the brake drag condition is still present.	Go to Step 13	Go to Step 12

Step	Action	Yes	No
	Do the brake corners still exhibit the brake drag condition?		
12	Replace the brake booster assembly. Did you complete the replacement?	Go to Step 14	-
13	1. Inspect the hydraulic brake system for the following conditions. • Improper operation of caliper pistons • Contaminated brake fluid • Internally damaged flexible brake hoses; hindering brake release • Damaged or improperly operating master cylinder 2. Adjust, repair or replace components as necessary. <u>Hydraulic Brake System Diagnosis</u> Did you find and correct a condition?	Go to Step 14	Go to <u>Diagnostic Starting Point - Vehicle</u>
14	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. <u>Brake System Vehicle Road Test</u> Is the condition still present?	Go to Step 2	System OK

BRAKE SYSTEM SLOW RELEASE

Step	Action	Yes	No
DEFINITION: Brake system releases and returns to rest slowly; vehicle motion is hindered by brake system briefly after release of brake pedal.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to <u>Symptoms - Hydraulic Brakes</u>
2	1. Inspect the hydraulic brake and assist system for the following conditions: • Improper operation of caliper pistons • Internally damaged flexible brake hoses; hindering brake release • Contaminated brake fluid • Damaged or improperly operating master cylinder • Damaged or improperly operating hydraulic booster, if equipped • Binding, bent or damaged pedal pushrod, pedal, or pedal bracket	Go to Step 4	Go to Step 3

Step	Action	Yes	No
	2. Adjust, repair or replace components as necessary. <u>Hydraulic Brake System Diagnosis</u> Did you find and correct a condition?		
3	1. Inspect the disc brake system for the following conditions: • Damaged or excessively worn caliper hardware and/or lining hardware • Distorted or damaged linings • Lack of lubrication or excessive corrosion on metal to metal contact surfaces • Bent or damaged caliper or mounting component 2. Adjust, repair or replace components as necessary. <u>Disc Brake System Diagnosis</u> Did you find and correct a condition?	Go to Step 4	Go to <u>Symptoms - Hydraulic Brakes</u>
4	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. <u>Brake System Vehicle Road Test</u> Is the condition still present?	Go to Step 2	System OK

BRAKE FLUID LOSS

Step	Action	Yes	No
DEFINITION: Brake fluid level is low not related to lining wear.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to <u>Diagnostic Starting Point - Vehicle</u>
2	1. Inspect the following hydraulic brake system components for brake fluid leaks: • Flexible brake hose connections; threaded and bolted • Flexible brake hose crimp joints • Brake pipe fittings • Caliper piston seals • Wheel cylinder piston seals, if equipped • Master cylinder reservoir • Master cylinder reservoir low pressure hose, if equipped	Go to Step 8	Go to Step 3

Step	Action	Yes	No
	Brake pressure modulator valve (BPMV) assembly, if equipped 2. Repair or replace components as necessary. <u>Hydraulic Brake System Diagnosis</u> Did you find and correct a condition?		
3	Is the vehicle equipped with a vacuum brake booster?	Go to Step 4	Go to Step 6
4	1. Disconnect the vacuum check valve from the booster to relieve vacuum reserve. 2. Separate the master cylinder from the vacuum brake booster. Do not disconnect any brake pipes. 3. Inspect the rear of the master cylinder for a brake fluid leak. 4. Inspect for brake fluid in the vacuum brake booster. Did you find a brake fluid leak?	Go to Step 5	Go to <u>Diagnostic Starting Point - Vehicle</u>
5	Replace the brake master cylinder and the vacuum brake booster. Did you complete the replacement?	Go to Step 8	-
6	1. Wipe clean the external surface of the master cylinder to hydraulic brake booster area, if equipped. 2. Separate the master cylinder from the hydraulic brake booster, if equipped. Do not disconnect any brake pipes. 3. Inspect the rear of the master cylinder for a brake fluid leak. Did you find a brake fluid leak?	Go to Step 7	Go to <u>Diagnostic Starting Point - Vehicle</u>
7	Replace the brake master cylinder. Did you complete the replacement?	Go to Step 8	-
8	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle to confirm proper operation. <u>Brake System Vehicle Road Test</u> Is the condition still present?	Go to Step 2	System OK

DISC BRAKE SYSTEM DIAGNOSIS

Test Description

The numbers below refer to the step numbers on the diagnostic table:

9

Lubricant leaks from non-brake system components may come in contact with and contaminate brake system components.

10

Lubricant leaks from non-brake system components may come in contact with and contaminate brake system components.

12

Disc brake rotor shields/backing plates that come in contact with disc brake rotors may cause brake system noise.

15

Disc brake rotor thickness variation that exceeds the maximum acceptable level can cause brake pulsation.

19

Disc brake rotor thickness variation that exceeds the maximum acceptable level can cause brake pulsation.

22

Disc brake rotor assembled lateral runout (LRO) that exceeds the maximum acceptable level can lead to thickness variation.

Step	Action	Yes	No
DEFINITION: This diagnostic table is designed to diagnose ONLY the components of the DISC brake system in order to determine if the DISC brake system is operating properly. You will be directed by the appropriate Symptom table to go to other brake system diagnostic tables as appropriate.			
1	Were you sent here from a Brake Symptom table?	Go to Step 2	Go to <u>Diagnostic Starting Point - Vehicle</u>
2	Visually inspect the disc brake pads for the following conditions: <u>Brake Pad Inspection</u> • Lining thickness below specifications • Uneven and/or abnormal wear - edge-to-edge and/or side-to-side • Looseness or damage - including pad hardware • Evidence of contamination from an external substance	Go to Step 3	Go to Step 12

Step	Action	Yes	No
	Did you find any conditions to indicate a concern with any of the front and/or rear disc brake pads?		
3	Are any of the front and/or rear disc brake pads contaminated?	Go to Step 8	Go to Step 4
4	Are any of the front and/or rear disc brake pads worn unevenly?	Go to Step 7	Go to Step 5
5	Are any of the front and/or rear disc brake pads and/or pad hardware loose or damaged?	Go to Step 7	Go to Step 6
6	1. Remove and inspect the worn disc brake pads for glazing, looseness, heat spots or damage. 2. Replace the worn disc brake pads as a complete axle set. <u>Front Disc Brake Pads Replacement</u> , and/or <u>Rear Disc Brake Pads Replacement</u> Did you complete the inspection and replacement?	Go to Step 12	-
7	CAUTION: Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake	Go to Step 12	-

Step	Action	Yes	No
	hose and in turn may cause a brake fluid leak. NOTE: Do NOT disconnect the hydraulic brake flex hoses from the calipers. 1. Remove the front and/or rear disc brake calipers, as appropriate, from the mounting brackets or from the suspension knuckles and support the calipers. Front Brake Caliper Replacement , and/or Rear Brake Caliper Replacement 2. Inspect the disc brake caliper mounting bracket and the mounting/sliding hardware for the following conditions: Front Disc Brake Mounting and Hardware Inspection , and/or Rear Disc Brake Mounting and Hardware Inspection • Binding or seized hardware • Worn, damaged or missing hardware components • Loose, bent, cracked, or damaged caliper mounting bracket 3. Replace components as required. Refer to the following procedures, as required: • Front Brake Caliper Bracket Replacement • Rear Brake Caliper Bracket Replacement 4. Replace the unevenly-worn, loose or damaged disc brake pads as a complete axle set. Front Disc Brake Pads Replacement , and/or Rear Disc Brake Pads Replacement Did you complete the inspection and replacement?		

Step	Action	Yes	No
8	1. Inspect the disc brake calipers, brake hoses and brake pipes for evidence of an external brake fluid leak. 2. Replace any components found to be leaking brake fluid. Refer to the following procedures as required: • Front Brake Caliper Replacement • Rear Brake Caliper Replacement • Front Brake Hose Replacement • Rear Brake Hose Replacement • Brake Pipe Replacement Did you find and correct the source of the leak causing contamination of the pads?	Go to Step 11	Go to Step 9
9	1. Inspect the wheel drive shaft outer seals for damage and evidence of a grease leak. 2. Replace any wheel drive shaft seal that is found to be leaking grease which may be the source of the contamination to the pads. Did you find and correct the source of the leak causing contamination of the pads?	Go to Step 11	Go to Step 10
10	1. Inspect the automatic transmission cooling system lines, if equipped, for damage and evidence of an external fluid leak which may be the source of the contamination to the pads. 2. Inspect the power steering system hoses for damage and evidence of an external fluid leak which may be the source of the contamination to the pads. 3. Replace any components found to be leaking fluid which may be the source of the contamination to the pads. Did you find and correct the source of the leak causing contamination of the pads?	Go to Step 11	-
11	1. Clean the remaining disc brake system components to remove any traces of the contaminant. CAUTION:	Go to Step 12	-

Step	Action	Yes	No
	Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak. NOTE: Do NOT disconnect the hydraulic brake flex hoses from the calipers. 2. Remove the front and/or rear disc brake calipers, as appropriate, from the mounting brackets and support the calipers. Front Brake Caliper Replacement , and/or Rear Brake Caliper		

Step	Action	Yes	No
	<u>Replacement</u> 3. Inspect the disc brake caliper mounting/sliding hardware for the following conditions: <u>Front Disc Brake Mounting and Hardware Inspection</u> , and/or <u>Rear Disc Brake Mounting and Hardware Inspection</u> • Binding or seized hardware • Distorted, worn, damaged or missing hardware components 4. Replace the caliper mounting/sliding hardware components as required. 5. Replace the contaminated disc brake pads as a complete axle set. <u>Front Disc Brake Pads Replacement</u> , and/or <u>Rear Disc Brake Pads Replacement</u> Did you complete the cleaning, inspection and replacement?		
12	Visually inspect each of the rear disc brake rotor shields/backing plates, if equipped, for evidence of contact with the brake rotors. Are any of the brake rotor shields/backing plates contacting the brake rotors?	Go to Step 13	Go to Step 14
13	Repair or replace the disc brake rotor shields/backing plates as required. <u>Front Brake Shield Replacement</u> , or <u>Rear Brake Shield Replacement</u> Did you complete the repair or replacement?	Go to Step 14	-

Step	Action	Yes	No
14	1. Check the thickness of each of the disc brake rotors. NOTE: Make the following determination AND ANSWER the question INDIVIDUALLY for EACH rotor. 2. Make a determination for each brake rotor if the rotor can be REFINISHED and REMAIN ABOVE the minimum requirements. Brake Rotor Thickness Measurement Does the disc brake rotor meet the minimum requirements for REFINISHING?	Go to Step 15	Go to Step 18
15	NOTE: Perform the following inspection AND ANSWER the question INDIVIDUALLY for EACH rotor. Inspect each of the disc brake rotors for thickness variation that exceeds the maximum acceptable level. Brake Rotor Thickness Variation Measurement Does the brake rotor exhibit thickness variation that exceeds the maximum acceptable level?	Go to Step 17	Go to Step 16
16	1. Inspect each of the disc brake rotors for the following surface and wear conditions: Brake Rotor Surface and Wear Inspection • Heavy rust and/or pitting • Cracks and/or heat spots • Excessive blueing discoloration • Deep or excessive scoring beyond maximum acceptable level	Go to Step 17	Go to Step 22

Step	Action	Yes	No
	NOTE: Make the following determination AND ANSWER the question INDIVIDUALLY for EACH rotor. 2. Make a determination for each brake rotor if the rotor requires refinishing based upon the results of the determination. Does the brake rotor require REFINISHING?		
17	1. Refinish the brake rotor. <u>Brake Rotor Refinishing</u> 2. Inspect the brake rotor thickness. <u>Brake Rotor Thickness Measurement</u> Were you able to REFINISH the brake rotor within the minimum requirements?	Go to Step 22	Go to Step 21
18	Is the brake rotor at or below the DISCARD requirements?	Go to Step 21	Go to Step 19
19	NOTE: Perform the following inspection AND ANSWER the question INDIVIDUALLY for EACH rotor. Inspect each of the disc brake rotors for thickness variation that exceeds the maximum acceptable level. <u>Brake Rotor Thickness Variation Measurement</u> Does the brake rotor exhibit thickness variation that exceeds the maximum acceptable level?	Go to Step 21	Go to Step 20
20	1. Inspect each of the disc brake rotors for the following surface and wear conditions: <u>Brake Rotor Surface and Wear Inspection</u> • Heavy rust and/or pitting • Cracks and/or heat spots • Excessive blueing discoloration • Deep or excessive scoring beyond maximum acceptable level	Go to Step 21	Go to Step 22

Step	Action	Yes	No
	NOTE: Make the following determination AND ANSWER the question INDIVIDUALLY for EACH rotor. 2. Make a determination for each brake rotor if the rotor requires replacement based upon the results of the inspection. If the brake rotor exhibits any of the conditions listed previously, it requires replacement. Does the brake rotor require REPLACEMENT?		
21	NOTE: Whenever a brake rotor is replaced, the assembled lateral runout (LRO) of the rotor must be measured to ensure optimum performance of the disc brakes. Replace the brake rotor. <u>Front Brake Rotor Replacement</u> , or <u>Rear Brake Rotor Replacement</u> Did you complete the replacement?	Go to Step 24	-
22	NOTE: Perform the following inspection AND ANSWER the question INDIVIDUALLY for EACH rotor. Inspect each of the disc brake rotors for assembled LRO that exceeds the maximum acceptable level. <u>Brake Rotor Assembled Lateral Runout Measurement</u> Does the brake rotor exhibit assembled LRO that exceeds the maximum acceptable level?	Go to Step 23	Go to Step 24

Step	Action	Yes	No
23	Correct the LRO for each brake rotor that was determined to have LRO exceeding the maximum acceptable level. <u>Brake Rotor Assembled Lateral Runout Measurement</u> Did you complete the operation?	Go to Step 24	-
24	Install or connect components that were removed or disconnected during diagnosis. Did you complete the operation?	Disc Brake System OK Return to Symptom Table	-

HYDRAULIC BRAKE SYSTEM DIAGNOSIS

Step	Action	Yes	No
DEFINITION: This diagnostic table is designed to diagnose ONLY the components of the HYDRAULIC brake system in order to determine if the HYDRAULIC brake system is operating properly. You will be directed by the appropriate Symptom table to go to other brake system diagnostic tables as appropriate.			
1	Were you sent here from a Brake Symptom table?	Go to Step 2	Go to <u>Symptoms - Hydraulic Brakes</u>
2	Inspect and adjust the brake fluid level in the brake master cylinder. <u>Master Cylinder Reservoir Filling</u> Was the brake fluid level low?	Go to Step 3	Go to Step 4
3	- Inspect the brake fluid for the following conditions, indicating brake fluid contamination: - Fluid separation, indicating two types of fluid are present - Swirled appearance - oil-based substance - Layered appearance - silicone-based substance - Fluid discoloration - Cloudy appearance - moisture - Dark appearance/ suspended particles in fluid - dirt, rust, corrosion, brake dust - Inspect the master cylinder reservoir cap diaphragm and the reservoir-to-master cylinder grommets for swelling, indicating fluid contamination. Do any of the above conditions exist?	Go to Step 5	Go to Step 6
4	- Inspect the brake fluid for the following conditions, indicating brake fluid contamination: - Fluid separation, indicating two types of	Go to Step 5	Go to Step 12

Step	Action	Yes	No
	fluid are present • Swirled appearance - oil-based substance • Layered appearance - silicone-based substance • Fluid discoloration • Cloudy appearance - moisture • Dark appearance/ suspended particles in fluid - dirt, rust, corrosion, brake dust 2. Inspect the master cylinder reservoir cap diaphragm and the reservoir-to-master cylinder grommets for swelling, indicating fluid contamination. Do any of the above conditions exist?		
5	1. Flush the hydraulic brake system. <u>Hydraulic Brake System Flushing</u> 2. If the brake fluid WAS contaminated with an oil-based or a silicone-based fluid, indicated by fluid separation and/or a swollen master cylinder reservoir cap diaphragm and/or swollen reservoir-to-master cylinder grommets, perform the following steps. Refer to the procedures indicated. 1. Remove ALL of the following components listed. Each component contains internal rubber seals/linings which have been contaminated. 2. Clean out the hydraulic brake pipes using denatured alcohol, or equivalent. 3. Dry the brake pipes using non-lubricated, filtered air. 4. Repair or replace ALL of the following components listed. Each component contains internal rubber seals/linings which have been contaminated. • Replace the brake master cylinder reservoir cap diaphragm. • <u>Master Cylinder Replacement</u> • Brake master cylinder reservoir: Clean the brake master cylinder reservoir using denatured alcohol, or	Go to Step 9	-

Step	Action	Yes	No
	equivalent, then dry the reservoir using non-lubricated, filtered air, or if necessary, replace the brake master cylinder reservoir. • <u>Front Brake Hose Replacement</u> • <u>Rear Brake Hose Replacement</u> • <u>Front Brake Caliper Overhaul</u> , <u>Front Brake Caliper Replacement</u> • <u>Rear Brake Caliper Replacement</u> • <u>Electronic Brake Control Module with Brake Pressure Modulator Valve Replacement</u> 3. If the brake fluid was NOT contaminated with an oil-based fluid, but WAS contaminated with water or dirt, rust, corrosion, and/or brake dust, replace the brake master cylinder reservoir cap diaphragm which may have allowed moisture or dirt to enter the system. 4. Refill and bleed the hydraulic brake system. <u>Hydraulic Brake System Bleeding</u> Did you complete the operation and any required repairs and/or replacements?		
6	1. Inspect the following hydraulic brake system components for external fluid leaks. Repair or replace any of the components found to be leaking brake fluid. Refer to the appropriate procedures: • Brake master cylinder reservoir cap diaphragm • <u>Master Cylinder Replacement</u> • <u>Front Brake Hose Replacement</u> • <u>Rear Brake Hose Replacement</u> • <u>Brake Pipe Replacement</u> • <u>Front Brake Caliper Overhaul</u> , <u>Front Brake Caliper Replacement</u> • <u>Rear Brake Caliper Replacement</u> • <u>Electronic Brake Control Module with Brake Pressure Modulator Valve Replacement</u> 2. If you repaired or replaced any of the brake system components listed, bleed the hydraulic brake system. <u>Hydraulic Brake System Bleeding</u>	Go to Step 7	Go to Step 12

Step	Action	Yes	No
	While bleeding the hydraulic brake system, observe for the following conditions: • The presence of air in the system at a bleeder valve location other than at the repair location, except if the brake master cylinder, and/or the proportioning valve assembly, was replaced • An unrestricted and even flow of brake fluid per axle during the bleeding procedure Did you find and correct a condition?		
7	Was there air in the system at a bleeder valve location other than at the repair location, except if the brake master cylinder, and/or the proportioning valve assembly, was replaced?	Go to Step 19	Go to Step 8
8	Was the flow of brake fluid unrestricted and even per axle during the bleeding procedure?	Go to Step 9	Go to Step 10
9	Inspect the hydraulic function of the brake calipers and/or wheel cylinders, if equipped for proper operation. Hydraulic Brake Component Operation Visual Inspection Was the hydraulic function of the brake calipers/wheel cylinders operating properly?	Go to Step 21	Go to Step 14
10	Was the flow of brake fluid restricted or uneven through front axle hydraulic components during the bleeding procedure?	Go to Step 13	Go to Step 11
11	Was the flow of brake fluid restricted or uneven through rear axle hydraulic components during the bleeding procedure?	Go to Step 17	-
12	Inspect the hydraulic function of the brake calipers/wheel cylinders for proper operation. Hydraulic Brake Component Operation Visual Inspection Was the hydraulic function of the brake calipers/wheel cylinders operating properly?	Go to Step 15	Go to Step 13
13	Determine if the brake caliper is restricting the flow of brake fluid and/or not operating properly: 1. Raise and support the vehicle. Lifting and Jacking the Vehicle 2. Remove the tire and wheel assemblies. Tire and Wheel Removal and Installation 3. Open the suspected caliper bleeder valve. 4. Using a large C-clamp, compress the caliper piston and observe for an unrestricted flow of	Go to Step 17	Go to Step 14

Step	Action	Yes	No
	brake fluid and for free movement of the caliper piston. 5. Close the caliper bleeder valve. Was the flow of brake fluid unrestricted and did the caliper piston move freely?		
14	Repair or replace any brake caliper/wheel cylinder that was not operating properly. • Front Brake Caliper Overhaul , Front Brake Caliper Replacement • Rear Brake Caliper Replacement Did you complete the repair and/or replacement?	Go to Step 21	-
15	Bleed the hydraulic brake system to observe for the presence of air in the system and to observe for an unrestricted and even flow of brake fluid per axle during the bleeding procedure. Hydraulic Brake System Bleeding Was there air in the system?	Go to Step 19	Go to Step 16
16	Was the flow of brake fluid unrestricted and even per axle during the bleeding procedure?	Go to Step 21	Go to Step 17
17	1. Inspect the hydraulic brake pipes and flexible brake hoses for signs of a fluid restriction; such as being bent, kinked, pinched or damaged. Brake Pipe and Hose Inspection 2. Replace any of the hydraulic brake pipes and/or flexible brake hoses found to be bent, kinked, pinched, or damaged. • Front Brake Hose Replacement • Rear Brake Hose Replacement • Brake Pipe Replacement 3. If none of the hydraulic brake pipes or flexible brake hoses were visibly bent, kinked, pinched, or damaged, replace the hydraulic brake flex hose at the restricted location. Did you find and correct a condition?	Go to Step 21	Go to Step 18
18	Replace the brake modulator assembly, in order to correct the hydraulic brake dynamic rear proportioning mechanical operation. Electronic Brake Control Module with Brake Pressure Modulator Valve	Go to Step 21	-

Step	Action	Yes	No
	<u>Replacement</u> Did you complete the replacement?		
19	1. Inspect the hydraulic brake system components for brake fluid seepage at a seal and/or fitting location, which may have drawn air into the system. 2. Inspect the hydraulic brake system components for evidence of a recent repair, which may have introduced air into the system. 3. Repair or replace any of the components found to be installed incorrectly or seeping brake fluid. Did you find and correct a condition?	Go to Step 21	Go to Step 20
20	1. Inspect the brake master cylinder for internal fluid leaks. <u>Brake System Internal Leak Test</u> 2. Repair or replace the brake master cylinder if it is found to be leaking brake fluid internally. <u>Master Cylinder Replacement</u> Did you find and correct a condition?	Go to Step 21	Return to Symptom Table
21	Install or connect components that were removed or disconnected during diagnosis. Did you complete the operation?	Hydraulic Brake System OK Return to Symptom Table	-

BRAKE SYSTEM VEHICLE ROAD TEST

Preliminary Inspections

1. Visually inspect easily accessible brake system components for obvious damage and/or leaks which may indicate that the vehicle should not be driven until further inspections have been completed.
2. Inspect the brake master cylinder reservoir fluid level and adjust only if necessary for brake system road testing. **Master Cylinder Reservoir Filling**
3. Inspect the tire inflation pressures and adjust as necessary.
4. Inspect the tire tread patterns to ensure that they are the same or very similar, especially per axle.
5. Ensure that the vehicle is not loaded unevenly prior to brake system road testing.

Road Testing Procedure

WARNING: Road test a vehicle under safe conditions and while obeying all traffic laws. Do not attempt any maneuvers that could jeopardize vehicle control. Failure to adhere to these precautions could lead to serious personal injury and vehicle damage.

1. Start the engine and allow it to idle.

2. Check to see if the brake system warning lamp remains illuminated.
3. If the brake system warning lamp remains illuminated, DO NOT proceed to test drive the vehicle until it is diagnosed and repaired. **Symptoms - Hydraulic Brakes**
4. Select a smooth, dry, clean and level road or large lot that is as free of traffic and obstacles as possible for brake system low speed road testing.
5. With the transmission in PARK, lightly apply the brake pedal. Observe both the pedal feel and the pedal travel.
6. If the brake pedal apply felt spongy, or the pedal travel was excessive, DO NOT drive the vehicle until it is repaired.
7. If the brake pedal apply did not feel spongy and the pedal travel was not excessive, proceed to step 8.
8. Release and apply the brakes.
9. While continuing to apply the brakes, shift the transmission into DRIVE, release the brakes and allow the engine to idle the vehicle away from the stopped position. Observe for a slow release of the brake system.
10. With the aid of an assistant to observe the vehicle's performance from outside of the vehicle, drive the vehicle at a low speed and lightly apply the brakes while driving past the assistant. Have the assistant observe for brake system noise from the side of the vehicle closest to them, while you observe both the pedal effort and the pedal travel.
11. If the brake pedal apply effort was excessive, or the pedal travel was excessive, DO NOT continue to test drive the vehicle until it is repaired.
12. If the brake pedal apply effort was not excessive and the pedal travel was not excessive, proceed to step 13.
13. Drive the vehicle in the opposite direction, at the same low speed and lightly apply the brakes while driving past the assistant. Have the assistant observe for brake system noise from the side of the vehicle closest to him.
14. Drive the vehicle at a low speed and shift the transmission into NEUTRAL without applying the brakes. Observe for a rapid deceleration in vehicle speed, indicating possible brake drag.
15. Select a smooth, dry, clean and level road that is as free of heavy traffic as possible for brake system moderate speed road testing.
16. Drive the vehicle at a moderate speed. Observe for a pull and/or incorrect tracking of the vehicle without the brakes applied.
17. While continuing to drive the vehicle at a moderate speed, perform several light applies of the brakes. Observe the pedal effort and the pedal travel, observe for brake system noise, pulsation and/or brake drag.
18. If the brake pedal apply effort was excessive, or the pedal travel was excessive, DO NOT continue to test drive the vehicle until it is repaired.
19. If the brake pedal apply effort was not excessive and the pedal travel was not excessive, proceed to step 20.
20. While continuing to drive the vehicle at a moderate speed, perform several moderate applies of the brakes. Observe the pedal effort and the pedal travel, observe for brake system pulsation and/or uneven braking action - either side to side, or front to rear.

A small amount of vehicle front end dip is expected during a moderate apply of the brakes.

21. If the brake pedal apply effort was excessive, or the pedal travel was excessive, DO NOT continue to test

drive the vehicle until it is repaired.

BRAKE PEDAL TRAVEL MEASUREMENT AND INSPECTION

Special Tools

CH-28662 Brake Pedal Effort Gauge

For equivalent regional tools, refer to [Special Tools](#).

1. Perform this procedure with the power OFF and the brakes cool.

Fig. 2: Steering Wheel, Brake Pedal And Gauge

Courtesy of GENERAL MOTORS COMPANY

2. Install the **CH-28662** gauge (1), or equivalent, to the brake pedal (3).
3. Measure and record the distance (a) from the brake pedal (3) to the rim of the steering wheel (2). Note the points of measurement.

Fig. 3: Brake Pedal Components And Travel Measurement

Courtesy of **GENERAL MOTORS COMPANY**

4. Apply and maintain a force of 445 N (100 lb) to the brake pedal, as indicated on the **CH-28662** gauge (1), or equivalent.
5. While maintaining 445 N (100 lb) of force to the brake pedal (3), measure and record the distance (b) from the same point on the brake pedal (3) to the same point on the rim of the steering wheel (2).
6. Release the brake pedal (3) and repeat steps 4 and 5 to obtain a second measurement. After obtaining a second measurement, proceed to step 7.
7. Average the first and second measurements recorded for the 2 applies of the brakes.
8. Subtract the initial unapplied distance (a), from the average applied distance (b) to obtain the brake pedal travel measurement (c).
9. Compare the measurement obtained with the specification. Refer to **Brake System Specifications**.

BRAKE SYSTEM EXTERNAL LEAK INSPECTION

WARNING: Refer to **Brake Fluid Irritant Warning** .

CAUTION: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#) .

1. In order to inspect for external brake fluid leaks, first check the fluid level in the master cylinder.

While a slight brake fluid level drop can be considered a normal condition due to brake lining wear, a very low level may indicate a brake fluid leak in the hydraulic system.

If the fluid level is abnormally low, adjust the brake fluid level. [Master Cylinder Reservoir Filling](#)

2. Start the engine and allow it to idle.
3. Apply constant, moderate foot pressure to the brake pedal.

If the brake pedal gradually falls away while under foot pressure, there may be a brake fluid leak.

4. Turn OFF the ignition.
5. Visually inspect the following brake system components for brake fluid leaks, excessive corrosion, and damage. Give particular attention to all brake pipe and flexible hose connections to ensure that there are not any slight brake fluid leaks - even though the brake pedal may feel firm and hold steady:
 - Master cylinder brake pipe fittings
 - All brake pipe connections
 - Brake pipes
 - Brake hoses and connections
 - Brake calipers and/or wheel cylinders, if equipped
6. While slight dampness around the master cylinder reservoir can be considered acceptable, brake fluid leaking from any of the brake system components requires immediate attention. If any of these components exhibit signs of brake fluid leakage, repair or replace those components. After the repair or replacement, reinspect the hydraulic brake system to assure proper function.

BRAKE SYSTEM INTERNAL LEAK TEST

WARNING: Refer to [Brake Fluid Irritant Warning](#) .

CAUTION: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#) .

1. Ensure is ignition is OFF for at least 60 seconds to allow the system to depressurize and deplete the power reserve.
2. Apply the brake pedal several times to verify the power reserve is fully depleted.
3. Apply light, steady pressure to the brake pedal. Observe both the brake pedal feel and travel.
4. Release the brake pedal.
5. If the brake pedal apply felt spongy, but the brake pedal travel was not excessive, perform the following steps:
 1. Inspect the brake system for external leaks. [Brake System External Leak Inspection](#)
 2. Pressure bleed the brake system in order to purge any air that may be trapped in the system. [Hydraulic Brake System Bleeding](#)

Fig. 4: Identifying Brake Master Cylinder (Cross Sectional View)

Courtesy of GENERAL MOTORS COMPANY

6. If the brake pedal apply did not feel spongy, but the brake pedal travel was excessive, perform the following steps:
 1. Loosen the master cylinder-to-adapter mounting nuts.
 2. Carefully pull the master cylinder away from the adapter just enough to inspect the mounting surface of the master cylinder.
 3. Inspect the master cylinder mounting surface at the primary piston (2) for brake fluid leaks.
7. If the master cylinder exhibits any leakage around the primary piston (2), then the primary piston primary seal (4) and/or secondary seal (3) is leaking and the master cylinder requires replacement.
8. If the master cylinder primary piston (2) does not exhibit any leakage, install the master cylinder to the adapter and pressure bleed the brake system. **Hydraulic Brake System Bleeding**
9. If the brake pedal apply did not feel spongy, and the brake pedal travel was initially steady and not excessive, but then gradually fell, then the master cylinder requires replacement due to an internal leak past a piston seal.
10. If the brake pedal apply did not feel spongy, and the brake pedal travel was initially steady and not excessive, then fell slightly, then became steady again, then the brake pressure modulator valve (BPMV)

may be leaking internally, and may require replacement.

HYDRAULIC BRAKE COMPONENT OPERATION VISUAL INSPECTION

Fig. 5: Identifying Brake Caliper/Pad Inspection Areas

Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to [Brake Fluid Irritant Warning](#) .

CAUTION: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#) .

1. With the tire and wheel assemblies removed and the brake rotors retained by wheel lug nuts, visually inspect the caliper piston dust boot (2) sealing area to ensure that there are no brake fluid leaks.
2. If any evidence of a brake fluid leak is present, the brake caliper requires overhaul or replacement.
3. While the brake system is at rest (4), observe the position of the caliper piston (1) in relation to the caliper housing.
4. Have an assistant apply and release the brake pedal several times while you observe the operation of the hydraulic brake caliper.
 1. Observe the caliper piston (1) for unrestricted and even movement during each apply of the brake system (5).
 2. Observe the caliper piston (1) for an unrestricted and even return motion during each release of the brake system (6).
5. If the caliper piston (1) did not exhibit unrestricted and even movement during brake system apply and/or release, the piston square seal (3) may be worn or damaged and the caliper may require overhaul or replacement.

BRAKE PIPE AND HOSE INSPECTION

WARNING: Refer to [Brake Fluid Irritant Warning](#) .

CAUTION: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#) .

1. Visually inspect all of the brake pipes for the following conditions:
 - Kinks, improper routing, missing or damaged retainers, Leaking fittings, excessive corrosion
2. If any of the brake pipes exhibited any of the conditions listed, then the identified pipe, or pipes, require replacement.
3. Ensure that the vehicle axles are properly supported at ride height in order to maintain the proper relationship of the flexible brake hoses to the chassis.

Fig. 6: Identifying Flexible Brake Hose Failure Conditions

Courtesy of GENERAL MOTORS COMPANY

4. Visually inspect all of the flexible brake hoses for the following conditions:
 - Kinks (1), improper routing, twists, chafing, missing or damaged retainers
 - Leaking connections, cracking, dry-rot, blisters, bulges
5. If any of the flexible brake hoses exhibited any of the conditions listed, then the identified flexible brake hose, or hoses require replacement.
6. Tightly press the flexible brake hose with fingers to check whether there are any spongy spots (2) (which indicates the existence of interior blocking). Inspect the entire length of each hose.
7. If any of the flexible brake hoses were found to have soft spots (2), then the identified flexible brake hose, or hoses require replacement.

BRAKE PEDAL PUSHROD INSPECTION

Fig. 7: View of Brake Pedal Pushrod

Courtesy of GENERAL MOTORS COMPANY

1. Disconnect the brake pedal pushrod (1) from the brake pedal.
2. Inspect the brake pedal pushrod eyelet bushing (2), if equipped, for cracks and/or excessive wear.
3. Reposition the pedal pushrod boot (3) toward the front of the vehicle to expose as much of the pedal pushrod (1) as possible.
4. Inspect the brake pedal pushrod (1) for straightness.
5. If the brake pedal pushrod eyelet bushing (2) exhibited cracks and/or excessive wear, then the bushing requires replacement.
6. If the brake pedal pushrod (1) is not straight, then the pushrod requires replacement.
7. Return the pedal pushrod boot (3) to its original position on the pedal pushrod (1).
8. Connect the brake pedal pushrod (1) to the brake pedal.

REPAIR INSTRUCTIONS

HYDRAULIC BRAKE FLUID REPLACEMENT

WARNING: [Brake Fluid Irritant Warning](#)

CAUTION: [Brake Fluid Effects on Paint and Electrical Components Caution](#)

CAUTION: Only use products that comply with GM specifications and check manufacturer information respectively. We recommend the use of GM genuine products. Instructions must be followed at all times. The use of any type of fluid other than the recommended type of brake fluid, may cause contamination which could result in damage to the internal rubber seals and/or rubber linings of hydraulic brake system components.

1. With the engine OFF, apply and release the brake pedal several times until the pedal effort becomes firm to deplete the brake booster power reserve.
2. Clean the outer surface of the master cylinder brake fluid reservoir, on and around the reservoir cap, prior to removing the cap and diaphragm. [Master Cylinder Reservoir Filling](#)
3. Fill the master cylinder brake fluid reservoir to the maximum-fill level with GM approved brake fluid from a clean, sealed brake fluid container. [Adhesives, Fluids, Lubricants, and Sealers](#)
4. Maintain the brake fluid level in the master cylinder brake fluid reservoir to between the minimum and maximum-fill level during the brake fluid replacement procedure.
5. Following the hydraulic brake system bleeding procedure, bleed each of the hydraulic brake wheel circuits until clean, clear brake fluid is observed coming from each bleeder valve. [Hydraulic Brake System Bleeding](#)
6. Fill the master cylinder brake fluid reservoir to the maximum-fill level with GM approved brake fluid from a clean, sealed brake fluid container. [Master Cylinder Reservoir Filling](#)
7. Securely install the master cylinder brake fluid reservoir diaphragm and cap.
8. Slowly apply and release the brake pedal, observing the brake pedal feel.
9. If the brake pedal feels spongy, perform the following:
 1. Visually inspect the hydraulic brake system for external leaks. [Brake System External Leak Inspection](#)
 2. Using a scan tool, perform the antilock brake system automated bleed procedure to remove any air that may have become trapped in the brake pressure modulator valve (BPMV). [Antilock Brake System Automated Bleed](#)

MASTER CYLINDER RESERVOIR FILLING

WARNING: Refer to [Brake Fluid Irritant Warning](#) .

CAUTION: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#) .

Fig. 8: Inspecting Brake Fluid Level Through Brake Master Cylinder Reservoir

Courtesy of GENERAL MOTORS COMPANY

1. Visually inspect the brake fluid level through the brake master cylinder reservoir.
2. If the brake fluid level is half way or less between the MAX and MIN levels (1) in the master cylinder reservoir, the brake system should be inspected for wear and possible brake fluid leaks.
3. If the brake fluid level is half way or less between the MAX and MIN levels during routine fluid checks, and an inspection of the brake system did not reveal wear or brake fluid leaks, the brake fluid may be topped-off up to the MAX fill level.
4. If brake system service was just completed, the brake fluid may be topped-off up to the MAX fill level.
5. If the brake fluid level is above the half way point, adding brake fluid is not recommended under normal conditions.
6. If brake fluid is to be added to the master cylinder reservoir, clean the outside of the reservoir on and around the reservoir cap prior to removing the cap and diaphragm.
7. If necessary, add GM approved brake fluid from a clean, sealed brake fluid container. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#).

MASTER CYLINDER RESERVOIR REPLACEMENT

Removal Procedure

WARNING: Brake Fluid Irritant Warning

WARNING: Use of eye goggles is necessary to prevent personal injury.

CAUTION: Brake Fluid Effects on Paint and Electrical Components Caution

1. Remove Dash Upper Extension Panel Opening Cover Replacement
2. Using a suitable tool, remove and properly dispose of the brake fluid from the brake master cylinder reservoir.

Fig. 9: Radiator Surge Tank And Bracket Clip
Courtesy of GENERAL MOTORS COMPANY

3. Remove Clip(2)@Radiator Surge Tank (1)
4. Slide the radiator surge tank forward and lift to remove.

Fig. 10: Electrical Connector And Brake Fluid Level Sensor

Courtesy of GENERAL MOTORS COMPANY

5. Disconnect Electrical Connector (2) @Brake Fluid Level Sensor (1)

Fig. 11: Brake Master Cylinder Reservoir And Body Wiring Harness

Courtesy of GENERAL MOTORS COMPANY

6. Unclip Clip (2)@Brake Master Cylinder Reservoir (3)
7. Unclip Clip (4) @Brake Master Cylinder Reservoir
8. Body Wiring Harness (1) @Brake Master Cylinder Reservoir

Fig. 12: Brake Master Cylinder Reservoir Hose

Courtesy of GENERAL MOTORS COMPANY

NOTE: Cap the opening to prevent contamination.

9. Disconnect Brake Master Cylinder Reservoir Hose (2)

10. Remove Bolt (3) @Brake Master Cylinder Reservoir (1)

Fig. 13: Brake Master Cylinder Reservoir

Courtesy of GENERAL MOTORS COMPANY

NOTE: Protect the windshield edge before removing the component.

11. Remove Brake Master Cylinder Reservoir (1) @Brake Master Cylinder (3)
12. Remove Brake Master Cylinder Reservoir Seal (2) @Brake Master Cylinder
13. Remove **Brake Fluid Level Sensor Replacement**

Installation Procedure

1. Install **Brake Fluid Level Sensor Replacement**

Fig. 14: Brake Master Cylinder Reservoir

Courtesy of GENERAL MOTORS COMPANY

2. Lubricate the brake master cylinder reservoir seals with GM approved brake fluid from a clean, sealed,

brake fluid container. - [Adhesives, Fluids, Lubricants, and Sealers](#)

3. Install Brake Master Cylinder Reservoir Seal (2) @Brake Master Cylinder (3)
4. Install Brake Master Cylinder Reservoir (1) @Brake Master Cylinder

Fig. 15: Brake Master Cylinder Reservoir Hose
Courtesy of GENERAL MOTORS COMPANY

5. Connect Brake Master Cylinder Reservoir Hose (2)

CAUTION: [Fastener Caution](#)

6. Install Bolt (3) @Brake Master Cylinder Reservoir (1) and tighten 2.5 N.m (22 lb in)

Fig. 16: Brake Master Cylinder Reservoir And Body Wiring Harness
Courtesy of GENERAL MOTORS COMPANY

7. Install Body Wiring Harness (1) @Brake Master Cylinder Reservoir (3)
8. Install Clip (2) @Brake Master Cylinder Reservoir

9. Clip (4) @Brake Master Cylinder Reservoir

Fig. 17: Electrical Connector And Brake Fluid Level Sensor
Courtesy of GENERAL MOTORS COMPANY

10. Connect Electrical Connector (2) @Brake Fluid Level Sensor (1)

Fig. 18: Radiator Surge Tank And Bracket Clip
Courtesy of GENERAL MOTORS COMPANY

11. Install the radiator surge tank into the bracket and slide rearward to secure.(1)
12. Install Clip (2) @Radiator Surge Tank
13. Install **Dash Upper Extension Panel Opening Cover Replacement**
14. Bleed the brake system. **Hydraulic Brake System Bleeding**

MASTER CYLINDER REPLACEMENT

Fig. 19: Master Cylinder
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: <u>Brake Fluid</u> <u>Irritant</u> <u>Warning</u>	
WARNING: <u>Eye</u> <u>Protection</u> <u>Warning</u>	
CAUTION: <u>Brake Fluid</u> <u>Effects on</u> <u>Paint and</u> <u>Electrical</u> <u>Components</u> <u>Caution</u>	
CAUTION: If there is no brake fluid in	

Callout	Component Name
the master cylinder, remove one of the brake booster fuses before applying the brake pedal. Failure to do so may damage the electric brake booster. Preliminary Procedures 1. Remove one of the electric brake booster fuses from the engine compartment fuse block. 2. Dash Upper Extension Panel Opening Cover Replacement 3. Master Cylinder Reservoir Replacement	
1	Brake Pipe Fitting (Qty: 2) CAUTION: Fastener Caution Tighten 32 N.m (24 lb ft)
2	Brake Master Cylinder Bolt Tighten 22 N.m (16 lb ft)
3	Brake Master Cylinder Procedure Replace the power brake booster gasket. NOTE: Protect the windshield edge before removing the component. Cap the brake pipe fitting

Callout	Component Name
	and plug the brake master cylinder outlet port to prevent brake fluid loss and contamination.
4	Brake Master Cylinder Seal Procedure Lubricate the seal with GM approved brake fluid from a clean, sealed, brake fluid container.

MASTER CYLINDER OVERHAUL

WARNING: Refer to [Brake Fluid Irritant Warning](#) .

CAUTION: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#) .

Disassembly Procedure

Fig. 20: Identifying Brake Master Cylinder (Cross Sectional View)

Courtesy of GENERAL MOTORS COMPANY

1. Remove the brake master cylinder from the vehicle. Refer to [**Master Cylinder Replacement**](#).
2. Secure the mounting flange of the brake master cylinder in a bench vise so that the rear of the primary piston is accessible.
3. Clean the outside of the master cylinder reservoir on and around the reservoir cap prior to removing the cap and diaphragm.
4. Remove the reservoir cap and diaphragm from the reservoir.
5. Inspect the reservoir cap and diaphragm for the following conditions. If any of these conditions are present, replace the affected components.
 - Cuts or cracks
 - Nicks or deformation
6. Remove the master cylinder reservoir from the master cylinder. Refer to [**Master Cylinder Reservoir Replacement**](#).
7. Using a smooth, round-ended tool, depress the primary piston (2) and remove the piston retainer.
8. Remove the primary piston assembly from the cylinder bore.
9. Plug the cylinder inlet ports and the rear outlet port. Apply low pressure, non-lubricated, filtered air into the front outlet port, in order to remove the secondary piston (1) with the primary (6) and secondary (5) seals, and the return spring.
10. Discard the primary piston assembly, the piston retainer, and the seals and seal retainer from the secondary piston.

Assembly Procedure

Fig. 21: Identifying Brake Master Cylinder (Cross Sectional View)

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not use abrasives to clean the brake master cylinder bore.

1. Clean the interior and exterior of the master cylinder, the secondary piston (1), and the return spring in denatured alcohol, or equivalent.
2. Inspect the master cylinder bore, inlet and outlet ports, the secondary piston (1), and the return spring for cracks, scoring, pitting, and/or corrosion. Replace the master cylinder if any of these conditions exist.
3. Dry the master cylinder and the individual components with non-lubricated, filtered air.
4. Lubricate the master cylinder bore, the secondary piston (1), the return spring, and all of the individual overhaul components with Delco Supreme 11[®], GM P/N 12377967 (Canadian P/N 992667), or equivalent DOT - 3 brake fluid from a clean, sealed brake fluid container.
5. Assemble the lubricated, new primary seal (6) and retainer, and new secondary seal (5) onto the secondary piston.
6. Install the lubricated return spring and secondary piston assembly (1) into the cylinder bore.
7. Install the lubricated, new primary piston assembly (2) into the cylinder bore.
8. Using a smooth, round-ended tool, depress the primary piston (2) and install the new piston retainer.

9. Install the master cylinder reservoir to the master cylinder. Refer to [Master Cylinder Reservoir Replacement](#).
10. Install the reservoir cap and diaphragm to the reservoir.
11. Install the master cylinder to the vehicle. Refer to [Master Cylinder Replacement](#).

MASTER CYLINDER BENCH BLEEDING

Fig. 22: Bleeding Master Cylinder

Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to [Brake Fluid Irritant Warning](#) .

CAUTION: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#) .

1. Secure the mounting flange of the brake master cylinder in a bench vise so that the rear of the primary piston is accessible.
2. Remove the master cylinder reservoir cap and diaphragm.
3. Install suitable fittings to the master cylinder ports that match the type of flare seat required and also

provide for hose attachment.

4. Install transparent hoses to the fittings installed to the master cylinder ports, then route the hoses into the master cylinder reservoir.
5. Fill the master cylinder reservoir to at least the half-way point with GM approved brake fluid from a clean, sealed brake fluid container. Adhesives, Fluids, Lubricants, and Sealers
6. Ensure that the ends of the transparent hoses running into the master cylinder reservoir are fully submerged in the brake fluid.
7. Using a smooth, round-ended tool, depress and release the primary piston as far as it will travel, a depth of about 25 mm (1 in), several times. Observe the flow of fluid coming from the ports.

As air is bled from the primary and secondary pistons, the effort required to depress the primary piston will increase and the amount of travel will decrease.

8. Continue to depress and release the primary piston until fluid flows freely from the ports with no evidence of air bubbles.
9. Remove the transparent hoses from the master cylinder reservoir.
10. Install the master cylinder reservoir cap and diaphragm.
11. Remove the fittings with the transparent hoses from the master cylinder ports. Wrap the master cylinder with a clean shop cloth to prevent brake fluid spills.
12. Remove the master cylinder from the vise.

BRAKE MASTER CYLINDER SHIELD REPLACEMENT

Removal Procedure

1. Remove Dash Upper Extension Panel Opening Cover Replacement

Fig. 23: Fuel Feed Hose

Courtesy of GENERAL MOTORS COMPANY

2. Disconnect Fuel Feed Hose (1) @Clip

Fig. 24: Radiator Surge Tank And Bracket Clip
 Courtesy of GENERAL MOTORS COMPANY

3. Remove Radiator Surge Tank Bracket Clip (2)

NOTE: Do NOT disconnect the engine coolant hoses.

4. Reposition away Radiator Surge Tank (1)

Fig. 25: Brake Master Cylinder Shield
 Courtesy of GENERAL MOTORS COMPANY

5. Disconnect the brake master cylinder shield (1) from the brake master cylinder assembly.

Installation Procedure

Fig. 26: Brake Master Cylinder Shield

Courtesy of GENERAL MOTORS COMPANY

1. Connect the brake master cylinder shield (1) to the brake master cylinder assembly.

Fig. 27: Radiator Surge Tank And Bracket Clip

Courtesy of GENERAL MOTORS COMPANY

2. Install Radiator Surge Tank (1)
3. Install Radiator Surge Tank Bracket Clip (2)

Fig. 28: Fuel Feed Hose

Courtesy of GENERAL MOTORS COMPANY

4. Install Fuel Feed Hose (1) @ Clip
5. Install **Dash Upper Extension Panel Opening Cover Replacement**

BRAKE FLUID LEVEL SENSOR REPLACEMENT

Removal Procedure

Fig. 29: Electrical Connector And Brake Fluid Level Sensor

Courtesy of GENERAL MOTORS COMPANY

1. Disconnect Electrical Connector (2) @Brake Fluid Level Sensor (1)

Fig. 30: Brake Fluid Level Sensor And Brake Master Cylinder Reservoir
 Courtesy of GENERAL MOTORS COMPANY

2. Disconnect Brake Fluid Level Sensor (2) @Brake Master Cylinder Reservoir (1)

Installation Procedure

Fig. 31: Brake Fluid Level Sensor And Brake Master Cylinder Reservoir
 Courtesy of GENERAL MOTORS COMPANY

1. Connect Brake Fluid Level Sensor (2) @Brake Master Cylinder Reservoir (1)

Fig. 32: Electrical Connector And Brake Fluid Level Sensor
 Courtesy of GENERAL MOTORS COMPANY

2. Connect Electrical Connector (2) @Brake Fluid Level Sensor (1)

BRAKE AND ACCELERATOR PEDAL ASSEMBLY REPLACEMENT

Removal Procedure

1. **High Voltage Disabling**
2. Remove **Accelerator Pedal Replacement**
3. Remove **Power Brake Master Cylinder Booster Assembly Replacement**
4. Remove **Instrument Panel Tie Bar Replacement**

Fig. 33: Brake And Accelerator Pedal Assembly And Nuts
 Courtesy of GENERAL MOTORS COMPANY

5. Remove the 2 brake and accelerator pedal assembly nuts (1) from the brake and accelerator pedal assembly (2).

Fig. 34: Brake And Accelerator Pedal Assembly
Courtesy of GENERAL MOTORS COMPANY

6. Remove the brake and accelerator pedal assembly (1) from the vehicle.

Installation Procedure

Fig. 35: Brake And Accelerator Pedal Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Install the brake and accelerator pedal assembly (1) to the vehicle.

Fig. 36: Brake And Accelerator Pedal Assembly And Nuts

Courtesy of GENERAL MOTORS COMPANY

2. Install the 2 brake and accelerator pedal assembly nuts (1) to the brake and accelerator pedal assembly (2) and tighten to 22 N.m (16 lb ft).
3. Install [Power Brake Master Cylinder Booster Assembly Replacement](#)
4. Install [Instrument Panel Tie Bar Replacement](#)
5. Install [Accelerator Pedal Replacement](#)
6. [High Voltage Enabling](#)

BRAKE PIPE REPLACEMENT

Special Tools

CH-45405 Brake Pipe Flaring Kit

For equivalent regional tools, refer to [Special Tools](#).

WARNING: Refer to [Brake Fluid Irritant Warning](#) .

WARNING: Always use double walled steel brake pipe when replacing brake pipes. The use of any other pipe is not recommended and may cause brake system failure. Carefully route and retain replacement brake pipes. Always use the correct fasteners and the original location for replacement brake pipes. Failure to properly route and retain brake pipes may cause damage to the brake pipes and cause brake system failure.

CAUTION: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#) .

NOTE: When servicing the brake pipes, note the following:

- If sectioning the brake pipe, use replacement pipe of the same type and outside diameter.

- **Use fittings of the appropriate size and type.**
- **Only create flares of the same type or design as originally equipped on the vehicle.**

1. Inspect the area of brake pipe to be repaired or replaced.
2. Remove components as necessary to gain access to the brake pipe to be repaired or replaced.
3. Release the brake pipe to be replaced from the retainers, as required.
4. Select an appropriate location to section the brake pipe, if necessary.
 - Allow adequate clearance in order to maneuver the **CH-45405** Brake Pipe Flaring Kit.
 - Avoid sectioning the brake pipe at bends or mounting points.
5. Using a string or wire, measure the length of the pipe to be replaced including all pipe bends.
6. Add to the measurement taken the appropriate additional length required for each flare to be created.

Specification

- 6.35 mm (0.250 in) for 4.76 mm (3/16 in) diameter pipe
- 9.50 mm (0.374 in) for 6.35 mm (1/4 in) diameter pipe
- 12.67 mm (0.499 in) for 7.94 mm (5/16 in) diameter pipe

Fig. 37: Sectioning Brake Pipe Using Pipe Cutter

Courtesy of GENERAL MOTORS COMPANY

NOTE: Ensure that the brake pipe end to be flared is cut at a square, 90 degree angle to the pipe length.

7. Using the pipe cutter included in the **CH-45405** Brake Pipe Flaring Kit, carefully cut the brake pipe squarely to the measured length.
8. Remove the sectioned brake pipe from the vehicle.
9. Select the appropriate size of brake pipe and tube nuts, as necessary. The brake pipe outside diameter determines brake pipe size.

Fig. 38: Stripping Nylon Coating From Brake Pipe Ends

Courtesy of GENERAL MOTORS COMPANY

10. Strip the nylon coating from the brake pipe end to be flared, if necessary.

- Select the appropriate blade on the coating stripping tool included in the **CH-45405** Brake Pipe Flaring Kit, by unthreading the blade block from the stripping tool and installing the block with the desired blade facing the tool rollers.

Specification

- 6.35 mm (0.250 in) blade for 4.76 mm (3/16 in) diameter pipe
- 9.50 mm (0.374 in) blade for 6.35 mm (1/4 in) and 7.94 mm (5/16 in) diameter pipe
- Insert the brake pipe end to be flared into the stripping tool to the depth of the ledge on the tool rollers.
- While holding the brake pipe firmly against the stripping tool roller ledges, rotate the thumbwheel of the tool until the blade contacts the brake pipe coated surface.

NOTE: Do not gouge the metal surface of the brake pipe.

- Rotate the stripping tool in a clockwise direction, ensuring that the brake pipe end remains against the tool roller ledges.
- After each successive revolution of the stripping tool, carefully rotate the thumbwheel of the tool clockwise, in order to continue stripping the coating from the brake pipe until the metal pipe surface is exposed.
- Loosen the thumbwheel of the tool and remove the brake pipe.

NOTE: Ensure that all loose remnants of the nylon coating have been removed from the brake pipe.

- Inspect the stripped end of the brake pipe to ensure that the proper amount of coating has been removed.

Specification

- 6.35 mm (0.250 in) for 4.76 mm (3/16 in) diameter pipe
- 9.50 mm (0.374 in) for 6.35 mm (1/4 in) and 7.94 mm (5/16 in) diameter pipe

Fig. 39: Chamfering Pipe Using De-Burring Tool
Courtesy of GENERAL MOTORS COMPANY

11. Chamfer the inside and outside diameter of the pipe with the de-burring tool included in the **CH-45405** Brake Pipe Flaring Kit.
12. Install the tube nuts on the brake pipe, noting their orientation.
13. Clean the brake pipe and the **CH-45405** Brake Pipe Flaring Kit of lubricant, contaminants, and debris.

Fig. 40: Installing Die Halves Into Die Cage
Courtesy of GENERAL MOTORS COMPANY

14. Loosen the die clamping screw of the **CH-45405** Brake Pipe Flaring Kit.
15. Select the corresponding die set and install the die halves into the die cage with the full, flat face of one die facing the clamping screw, and the counterbores of both dies facing the forming ram.

Fig. 41: View Of Clamping Screw & Unused Die
Courtesy of GENERAL MOTORS COMPANY

16. Place the flat face of an unused die (1) against the die halves in the clamping cage and hold firmly against the counterbored face of the dies.
17. Insert the prepared end of the pipe to be flared through the back of the dies until the pipe is seated against the flat surface of the unused die (1).
18. Remove the unused die (1).
19. Ensure that the rear of both dies are seated firmly against the enclosed end of the die cage.
20. Firmly hand tighten the clamping screw (2) against the dies.

Fig. 42: Rotating J 45405 To Bottom Against Die Cage

Courtesy of GENERAL MOTORS COMPANY

21. Select the appropriate forming mandrel and place into the forming ram.
22. Rotate the hydraulic fluid control valve clockwise to the closed position.
23. Rotate the body of the **CH-45405** Brake Pipe Flaring Kit until it bottoms against the die cage.

Fig. 43: Bottoming Forming Mandrel Against Clamping Dies Using Pipe Flaring Tool
Courtesy of GENERAL MOTORS COMPANY

24. While guiding the forming mandrel into the exposed end of pipe to be flared, operate the lever of the **CH-45405** Brake Pipe Flaring Kit until the forming mandrel bottoms against the clamping dies.
25. Rotate the hydraulic fluid control valve counterclockwise to the open position to allow the hydraulic forming ram to retract.

Fig. 44: Using Pipe Flaring Tool

Courtesy of GENERAL MOTORS COMPANY

26. Insert the finishing cone into the forming ram.
27. Rotate the hydraulic fluid control valve clockwise to the closed position.
28. Rotate the body of the **CH-45405** Brake Pipe Flaring Kit until it bottoms against the die cage.
29. While guiding the finishing cone into the exposed end of pipe to be flared, operate the lever of the **CH-45405** Brake Pipe Flaring Kit until the finishing cone bottoms against the dies.
30. Rotate the hydraulic fluid control valve counterclockwise to the open position to allow the hydraulic forming ram to retract.
31. Loosen the die clamping screw and remove the dies and pipe.
32. If necessary, lightly tap the dies until the die halves separate.

Fig. 45: Identifying Correct Brake Pipe Flare Shape & Diameter

Courtesy of GENERAL MOTORS COMPANY

33. Inspect the brake pipe flare for correct shape and diameter (a).

Specification

- 6.74 - 7.10 mm (0.265 - 0.279 in) flare diameter for 4.76 mm (3/16 in) diameter pipe
- 8.57 - 9.27 mm (0.344 - 0.358 in) flare diameter for 6.35 mm (1/4 in) diameter pipe
- 10.42 - 10.79 mm (0.410 - 0.425 in) flare diameter for 7.94 mm (5/16 in) diameter pipe

34. If necessary, using the removed section of brake pipe as a template, shape the new pipe with a suitable brake pipe bending tool.

NOTE: When installing the pipe, maintain a clearance of 19 mm (3/4 in) from all moving or vibrating components.

35. Install the pipe to the vehicle with the appropriate brake pipe unions, as required.

36. If previously released, secure the brake pipe to the retainers.

37. Install any components that may have been removed to gain access to the brake pipe.

38. Bleed the hydraulic brake system. [Hydraulic Brake System Bleeding](#)
39. With the aid of an assistant, inspect the brake pipe flares for leaks by starting the engine and applying the brakes.

BRAKE MASTER CYLINDER RESERVOIR HOSE REPLACEMENT

Removal Procedure

WARNING: [Brake Fluid Irritant Warning](#)

CAUTION: [Brake Fluid Effects on Paint and Electrical Components Caution](#)

1. Remove [Dash Upper Extension Panel Opening Cover Replacement](#)

Fig. 46: Radiator Surge Tank And Bracket Clip

Courtesy of GENERAL MOTORS COMPANY

2. Remove Radiator Surge Tank Bracket Clip (2)

NOTE: Do NOT disconnect the engine coolant hoses.

3. Reposition away Radiator Surge Tank (1)

Fig. 47: Brake Master Cylinder Reservoir And Hose

Courtesy of GENERAL MOTORS COMPANY

NOTE: Cap the opening to prevent contamination.

4. Disconnect the brake master cylinder reservoir hose (2) from the brake master cylinder reservoir (1).
5. Remove Brake Pipe Fitting (3) @Brake Pressure Modulator Valve
6. Remove the brake master cylinder reservoir hose from the vehicle.

Installation Procedure

Fig. 48: Brake Master Cylinder Reservoir And Hose

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Fastener Caution

1. Install Brake Pipe Fitting (3) @Brake Pressure Modulator Valve and tighten 32 N.m (24 lb ft)
2. Connect the brake master cylinder reservoir hose (2) to the brake master cylinder reservoir (1).

Fig. 49: Radiator Surge Tank And Bracket Clip

Courtesy of GENERAL MOTORS COMPANY

3. Install Radiator Surge Tank (1)
4. Install Radiator Surge Tank Bracket Clip (2)
5. Install [Dash Upper Extension Panel Opening Cover Replacement](#)
6. [Hydraulic Brake System Bleeding](#)

FRONT BRAKE HOSE REPLACEMENT

Removal Procedure

WARNING: Refer to [Brake Fluid Irritant Warning](#) .

CAUTION: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#) .

1. Remove [Tire and Wheel Removal and Installation](#)

Fig. 50: Front Brake Hose And Brake Hose Fitting Bolt

Courtesy of GENERAL MOTORS COMPANY

2. Remove Front Brake Hose (3) @Brake Hose Fitting Bolt (1)
3. Cap the brake hose fitting to prevent brake fluid loss and contamination.
4. Cap the brake caliper inlet port to prevent brake fluid loss and contamination.
5. DISCARD the brake hose fitting gaskets.(2)

Fig. 51: Front Brake Hose And Front Brake Pipe Fitting

Courtesy of GENERAL MOTORS COMPANY

6. Remove Front Brake Hose (2) @Front Brake Pipe Fitting (1)
7. Cap the brake pipe fitting to prevent brake fluid loss and contamination.
8. Cap the brake hose fitting to prevent brake fluid loss and contamination.

Installation Procedure

1. Remove the caps from brake pipe fitting and the brake hose.

Fig. 52: Front Brake Hose And Front Brake Pipe Fitting

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Fastener Caution](#) .

2. Install Front Brake Hose (2) @Front Brake Pipe Fitting (1) and tighten 20 N.m (15 lb ft)
3. Remove the caps from the brake hose and the brake caliper inlet port.

HYDRAULIC BRAKE SYSTEM BLEEDING

WARNING: Refer to [Brake Fluid Irritant Warning](#) .

CAUTION: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#) .

CAUTION: Only use products that comply with GM specifications and check manufacturer information respectively. We recommend the use of GM genuine products. Instructions must be followed at all times. The use of any type of fluid other than the recommended type of brake fluid, may cause contamination which could result in damage to the internal rubber seals and/or rubber linings of hydraulic brake system components.

If hydraulic components were serviced on only one wheel hydraulic circuit, perform the following procedure.

Bleeding a Single Hydraulic Brake Circuit

1. Place the Power button in the Service Only Mode.
2. Place a clean shop cloth beneath the brake master cylinder to catch brake fluid spills.
3. Clean the outside of the reservoir on and around the reservoir cap prior to removing the cap and diaphragm.
4. Fill the brake master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container. Refer to [Fluid and Lubricant Recommendations](#) .

NOTE: The pressure bleeding equipment must be the diaphragm type. The rubber diaphragm between the air supply and the brake fluid prevents air, moisture, oil, and other contaminants from entering the hydraulic system.

5. Following the brake pressure bleeder manufacturer's instructions, fill the brake pressure bleeder with GM approved brake fluid from a clean, sealed brake fluid container.
6. Install the appropriate master cylinder reservoir adapter and connect the brake pressure bleeder.
7. Charge the brake pressure bleeder air tank to 170-200 kPa/1.7-2.0 bar (25-30 psi), or as recommended by the brake pressure bleeder manufacturer's instructions.
8. Open the brake pressure bleeder fluid tank valve to allow pressurized brake fluid to enter the brake

hydraulic system.

NOTE: Any brake fluid leaks identified require repair prior to completing this procedure.

9. Wait approximately 30 seconds, then inspect the entire hydraulic brake system for external brake fluid leaks.
10. Install a proper box-end wrench onto the wheel hydraulic circuit bleeder valve which has been serviced.
11. Install a transparent hose over the end of the bleeder valve.
12. Submerge the open end of the transparent hose into a transparent container partially filled with brake fluid from a clean, sealed brake fluid container.
13. Loosen the bleeder valve to purge air from the wheel hydraulic circuit.
14. Allow fluid to flow until air bubbles stop flowing from the bleeder.
15. After all air has been purged from the hydraulic circuit, tighten the bleeder valve and install the dust cap.

NOTE: The brake reservoir may have residual pressure after the bleeding operation is complete. Wrap a clean shop towel around the bleeder adapter and all hose connections before disconnecting the pressure bleeding equipment to prevent brake fluid from contacting and damaging vehicle components and painted surfaces.

16. Close the brake pressure bleeder fluid tank valve then disconnect the brake pressure bleeder from the master cylinder reservoir bleeder adapter.
17. Remove the master cylinder reservoir bleeder adapter from the master cylinder reservoir.
18. Fill the brake master cylinder reservoir to the maximum-fill level with GM approved brake fluid from a clean, sealed brake fluid container.
19. Slowly press and release the brake pedal. Observe the brake pedal feel.
20. If the brake pedal feels spongy, perform the Bleeding the Complete Brake Hydraulic System procedure:
21. Turn the ignition key ON, with the engine OFF. Check to see if the brake system warning lamp remains illuminated.

NOTE: DO NOT allow the vehicle to be driven until it is diagnosed and repaired.

22. If the brake system warning lamp remains illuminated, refer to [Diagnostic Starting Point - Vehicle](#) .

Bleeding the Complete Brake Hydraulic System

1. Place the Power button in the Service Only Mode.
2. Place a clean shop cloth beneath the brake master cylinder to catch brake fluid spills.
3. Clean the outside of the reservoir on and around the reservoir cap prior to removing the cap and diaphragm.
4. Fill the brake master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container. Refer to [Fluid and Lubricant Recommendations](#) .
5. If the master cylinder was replaced, the master cylinder must be bench bled. Refer to [Master Cylinder Bench Bleeding](#).

NOTE: The pressure bleeding equipment must be the diaphragm type. The rubber diaphragm between the air supply and the brake fluid prevents air, moisture, oil, and other contaminants from entering the hydraulic system.

6. Following the brake pressure bleeder manufacturer's instructions, fill the brake pressure bleeder with GM approved brake fluid from a clean, sealed brake fluid container.
7. Install the appropriate master cylinder reservoir adapter and connect the brake pressure bleeder.
8. Charge the brake pressure bleeder air tank to 170-200 kPa/1.7-2.0 bar (25-30 psi), or as recommended by the brake pressure bleeder manufacturer's instructions.
9. Open the brake pressure bleeder fluid tank valve to allow pressurized brake fluid to enter the brake hydraulic system.

NOTE: Any brake fluid leaks identified require repair prior to completing this procedure.

10. Wait approximately 30 seconds, then inspect the entire hydraulic brake system for external brake fluid leaks.
11. Install a proper box-end wrench onto the RIGHT REAR wheel hydraulic circuit bleeder valve.
12. Install a transparent hose over the end of the bleeder valve.
13. Submerge the open end of the transparent hose into a transparent container partially filled with GM approved brake fluid from a clean, sealed brake fluid container.
14. Loosen the bleeder valve to purge air from the wheel hydraulic circuit.
15. Allow fluid to flow until air bubbles stop flowing from the bleeder.
16. After all air has been purged from the hydraulic circuit, tighten the bleeder valve and install the dust cap.
17. Install a proper box-end wrench onto the LEFT REAR wheel hydraulic circuit bleeder valve, then repeat steps 12-16.
18. Install a proper box-end wrench onto the RIGHT FRONT wheel hydraulic circuit bleeder valve, then repeat steps 12-16.
19. Install a proper box-end wrench onto the LEFT FRONT wheel hydraulic circuit bleeder valve, then repeat steps 12-16.
20. Close the brake pressure bleeder fluid tank valve.

NOTE: The brake reservoir may have residual pressure after the bleeding operation is complete. Wrap a clean shop towel around the bleeder adapter and all hose connections before disconnecting the pressure bleeding equipment to prevent brake fluid from contacting and damaging vehicle components and painted surfaces.

21. Remove the brake pressure bleeding equipment from the vehicle.
22. Fill the brake master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container. Refer to [Fluid and Lubricant Recommendations](#).
23. Slowly press and release the brake pedal. Observe the brake pedal feel.
24. If the brake pedal feels spongy, perform the following procedure.

1. If equipped with antilock brakes, install a scan tool and perform the [Antilock Brake System](#)

Automated Bleed to remove air which may be trapped in the BPMV.

2. Inspect the hydraulic brake system for external leaks. Refer to **Brake System External Leak Inspection**.
3. Repeat the Bleeding the Complete Brake Hydraulic System procedure.
25. If the brake pedal still feels spongy, pressure bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding**.
26. Turn the ignition switch ON with the engine OFF. Check to see if the brake system warning lamp remains illuminated.

NOTE: **DO NOT allow the vehicle to be driven until the brake system is diagnosed and repaired.**

27. If the brake system warning lamp remains illuminated, refer to **Diagnostic Starting Point - Vehicle** .

HYDRAULIC BRAKE SYSTEM FLUSHING

WARNING: Refer to **Brake Fluid Irritant Warning** .

CAUTION: Refer to **Brake Fluid Effects on Paint and Electrical Components Caution** .

CAUTION: **Only use products that comply with GM specifications and check manufacturer information respectively. We recommend the use of GM genuine products. Instructions must be followed at all times. The use of any type of fluid other than the recommended type of brake fluid, may cause contamination which could result in damage to the internal rubber seals and/or rubber linings of hydraulic brake system components.**

1. Inspect the brake fluid for the following conditions, indicating brake fluid contamination:
 - Fluid separation, indicating two types of fluid are present; a substance other than the recommended brake fluid has been introduced into the brake hydraulic system
 - Swirled appearance - oil-based substance
 - Layered appearance - silicone-based substance
 - Fluid discoloration, indicating the presence of moisture or particles that have been introduced into the brake hydraulic system
 - Cloudy appearance - moisture
 - Dark appearance/suspended particles in fluid - dirt, rust, corrosion, brake dust
2. Inspect the master cylinder reservoir cap diaphragm and the reservoir-to-master cylinder grommets for swelling, indicating brake fluid contamination.
3. If the brake fluid WAS contaminated with an oil-based or a silicone-based substance, indicated by fluid separation and/or a swollen master cylinder reservoir cap diaphragm and/or swollen reservoir-to-master cylinder grommets, perform the following:
 1. Remove ALL of the following components listed from the vehicle. Each component contains internal rubber seals/linings which have been contaminated by the contaminated brake fluid in the brake hydraulic system.
 - **Master Cylinder Replacement**

- [Front Brake Hose Replacement](#)
- [Rear Brake Hose Replacement](#)
- [Front Brake Caliper Replacement](#)
- [Rear Brake Caliper Replacement](#)
- [Electronic Brake Control Module with Brake Pressure Modulator Valve Replacement](#)

2. Clean out all the hydraulic brake pipes using denatured alcohol, or equivalent.
3. Dry the brake pipes using non-lubricated, filtered air.
4. Repair or replace ALL of the following components listed and install them to the vehicle. Each component contains internal rubber seals/linings which have been contaminated by the contaminated brake fluid in the brake hydraulic system.

- [Master Cylinder Replacement](#); also perform the following:

Clean the brake master cylinder reservoir using denatured alcohol, or equivalent, then dry the reservoir using non-lubricated, filtered air. Inspect the reservoir for cracks and/or damage and replace if necessary. [Master Cylinder Reservoir Replacement](#)

Replace the brake master cylinder reservoir cap.

- [Front Brake Hose Replacement](#)
- [Rear Brake Hose Replacement](#)
- [Front Brake Caliper Overhaul](#) , or [Front Brake Caliper Replacement](#)
- [Rear Brake Caliper Replacement](#)
- [Electronic Brake Control Module with Brake Pressure Modulator Valve Replacement](#)

4. If the brake fluid was NOT contaminated with an oil-based or a silicone-based substance, but WAS contaminated with water or dirt, rust, corrosion, and/or brake dust, replace the brake master cylinder reservoir cap. The diaphragm may have allowed the moisture or particles to enter the hydraulic system.
5. Fill the brake master cylinder reservoir to the maximum-fill level with GM approved brake fluid from a clean, sealed brake fluid container. [Adhesives, Fluids, Lubricants, and Sealers](#)
6. Pressure bleed the hydraulic brake system. Begin the procedure with the pressure bleeder reservoir filled to the maximum-fill level with the correct brake fluid as indicated. [Hydraulic Brake System Bleeding](#)

POWER BRAKE MASTER CYLINDER BOOSTER ASSEMBLY REPLACEMENT

Removal Procedure

WARNING: [Brake Fluid Irritant Warning](#)

CAUTION: [Brake Fluid Effects on Paint and Electrical Components Caution](#)

CAUTION: Do not lift or carry the electric brake booster by the input rod, electrical connectors or master cylinder reservoir. Failure to follow these steps may damage the electric brake booster.

CAUTION: If there is no brake fluid in the master cylinder, remove one of the brake booster fuses before applying the brake pedal. Failure to do so may

damage the electric brake booster.

1. Remove one of the electric brake booster fuses from the engine compartment fuse block.
2. Remove **Dash Upper Extension Panel Opening Cover Replacement**

25. [Hydraulic Brake System Bleeding](#)
26. Program and calibrate the power brake booster control module. Refer to [Control Module References](#) .

DESCRIPTION AND OPERATION

POWER BRAKE BOOSTER DESCRIPTION AND OPERATION

Power Brake Booster Description and Operation

The brake booster is an electromechanical brake booster that replaces a vacuum booster including its vacuum supply. It is designed to make hybrid and electric vehicles more efficient by providing situation-dependent support when a driver initiates braking.

The brake booster unit takes the driver applied brake demand and transforms this into an amplified brake pressure and does not rely on vacuum to function. The brake booster unit is designed to operate together with an electronic stability control module which is normally responsible for ABS, traction control and stability control.

Since the brake booster unit operates electromechanically, it does not require vacuum from the engine and recovers almost all the energy lost in typical braking. It uses electrical current only during braking.

The brake booster unit consists of a PSM motor for force build up, and ECU for the control of the brake booster, a stage gear control to transmit the motor torque to the output pressure in the master cylinder, a vehicle interface to connect the brake booster and the vehicle, a pedal coupling unit to couple the brake booster with the vehicle pedal unit, a pedal travel sensor to detect the driver brake request, TMC to connect the brake booster with the braking system and a reservoir to support the braking system with brake fluid.

For maximum efficiency, a hybrid or EV must recover as much energy as possible when braking. Ideally, a vehicle would be slowed down purely by the electric motor, avoiding the loss of valuable energy through braking. The system recovers almost all the energy lost in typical braking operations by ensuring deceleration rates of up to 0.3 g are achieved using the electric motor alone. If the brakes are applied harder, the brake booster system generates the additional braking pressure needed in the traditional way, using the brake master cylinder.

The brake booster unit is purely electromechanical, without brake fluid, which means it can be rotated flexibly about the longitudinal axis.

BRAKE WARNING SYSTEM DESCRIPTION AND OPERATION

Brake Warning Indicator

Fig. 74: Brake Warning Block Diagram

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
P16	P16 Instrument Cluster
B20	B20 Brake Fluid Level Switch
K17	K17 Electronic Brake Control Module

The instrument cluster turns the brake warning indicator ON when the following occurs:

- The instrument cluster performs the bulb check. The brake warning indicator illuminates for 5 seconds.
- When the EBCM detects a too low brake fluid level it sets a DTC and sends a serial data message to the instrument cluster, which will illuminate.

Electronic brake control module (EBCM) monitors the brake fluid level in the brake fluid reservoir. When the fluid within the brake fluid reservoir is below the MIN level, contacts within the brake fluid level switch closes causing the voltage within the signal circuit to drop. The electronic brake control module (EBCM) will detect the voltage drop and will send a serial data message to the instrument cluster commanding the brake warning indicator to illuminate.

HYDRAULIC BRAKE SYSTEM DESCRIPTION AND OPERATION

System Component Description

The hydraulic brake system consists of the following:

Hydraulic Brake Master Cylinder Fluid Reservoir

Contains supply of brake fluid for the hydraulic brake system.

Hydraulic Brake Master Cylinder

Converts mechanical input force into hydraulic output pressure.
Hydraulic output pressure is distributed from the master cylinder through 2 hydraulic circuits, supplying diagonally-opposed wheel apply circuits.

Hydraulic Brake Pressure Balance Control System

Regulates brake fluid pressure delivered to hydraulic brake wheel circuits, in order to control the distribution of braking force.
Pressure balance control is achieved through dynamic rear proportioning (DRP), which is a function of the ABS modulator.

Hydraulic Brake Pipes and Flexible Brake Hoses

Carries brake fluid to and from hydraulic brake system components.

Hydraulic Brake Wheel Apply Components

Converts hydraulic input pressure into mechanical output force.

System Operation

Mechanical force is converted into hydraulic pressure by the master cylinder, regulated to meet braking system demands by the pressure balance control system, and delivered to the hydraulic brake wheel circuits by the pipes and flexible hoses. The wheel apply components then convert the hydraulic pressure back into mechanical force which presses linings against rotating brake system components.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC C1138: SUPPLY VOLTAGE GOES BELOW 7 V AND ABOVE 16.5 V/SIGNAL PERFORMANCE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC C1138 03

Supply Voltage Goes Below 7 V

DTC C1138 07

Supply Voltage Goes Above 16.5 V

DTC C1138 58

Signal Performance

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	C1138 03	C1138 03	-	C1138 58
Ground	-	C1138 03	C1138 07	C1138 58

Circuit/System Description

The Electronic Brake Control Module monitors its supply voltage to verify the supply voltage is within the normal operating range

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

DTC C1138 03

The EBCM detects its supply voltage of less than approximately 7 V.

DTC C1138 07

The EBCM detects a supply voltage of more than 16.5 V.

DTC C1138 58

The Park Brake Controller (PBC) loses communication with the EBCM during park brake actuation.

Action Taken When the DTC Sets

- DTC is stored in memory.
- Park brake actuation unavailable.

Conditions for Clearing the DTC

The supply voltage returns to normal operating range.

Diagnostic Aids

- A high or low voltage DTC set or voltage value in multiple modules/sensors indicates a concern in the charging system.
- A possible cause of this DTC could be overcharging with a battery charger or jump starting.

Circuit/System Verification

1. Verify that no other DTCs are set.

- **If any other DTCs are set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

- **If no other DTCs are set**

2. Vehicle OFF, measure and record the battery voltage at the battery terminals.

3. Verify the battery voltage stabilizes between 12.4 V and 12.8 V within a few minutes of turning the vehicle OFF.

- **If battery voltage is less than 12.4 V or more than 12.8 V**

Refer to [Battery Inspection/Test](#) .

- **If battery voltage is between 12.4 and 12.8 V**

4. Engine running, headlights ON, measure and record the battery voltage at the battery terminals.

5. Verify the voltage is at least 1 V greater than the voltage measured in step 1, but less than 15 V.

- **If the voltage is not at least 1 V greater than the voltage measured in step 2 or is greater than 15 V.**

Refer to [Charging System Test](#) .

- **If the voltage is at least 1 V greater than the voltage measured in step 2, but less than 15 V.**

6. Verify the K17 Electronic Brake Control Module scan tool ignition voltage parameter is within 1 V of the battery voltage.

- **If not within 1 V of the battery voltage**

Refer to Circuit/System Testing.

- **If within 1 V of the battery voltage**

7. All OK.

Circuit/System Testing

NOTE:

- You must perform the Circuit/System Verification before Circuit/System Testing.
- Some control module ground circuits may require up to 20 min after the ignition is turned off before achieving a resistance reading of less than 5 Ω . In most cases the readings will drop below 20 Ω within 1 min indicating the control module is going to sleep.

DTC C1138 03 or DTC C1138 07

1. Ignition OFF and all vehicle systems OFF, disconnect the X1 harness connector at the K17 Electronic Brake Control Module. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between ground circuit terminal 46 and ground.
 - **If 10 Ω or greater**
 1. Ignition OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
3. Verify a test lamp illuminates between B+ circuit terminal 1 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K17 Electronic Brake Control Module.
 - **If the test lamp illuminates**
4. Replace the K17 Electronic Brake Control Module.

DTC C1138 58

1. Verify that no other DTCs are set.
 - **If any other DTCs are set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

- **If no other DTCs are set**

2. Using the S91 Park Brake Control Switch, apply and release the park brake.
3. Verify that the DTC does not reset.

- **If the DTC resets**

Replace the K17 Electronic Brake Control Module.

- **If the DTC does not reset**

4. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

[Control Module References](#) for control module replacement, programming and setup.

DTC C1148: LEFT PARK BRAKE ACTUATOR CIRCUIT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provide an overview of each diagnostic category.

DTC Descriptors

DTC C1148

Left Park Brake Actuator Circuit

For symptom byte information, refer to: [Symptom Byte List](#)

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Left Park Brake Actuator Apply Control	C1148 0C	C1148 04	C1148 0B	C1148 00 C1148 0F
Left Park Brake Actuator Release Control	C1148 0C	C1148 04	C1148 0B	C1148 00 C1148 0F

Circuit/System Description

The Electronic Brake Control Module will diagnose the park brake motor circuits to verify that they are functioning properly. The park brake motor circuits are used to command actuator motor operation, which will apply and release the parking brake. These circuits are used to activate the actuator, which applies or releases pressure on the rear caliper pistons, ultimately applying and releasing the park brake.

When the Park Brake Switch is pulled, a signal is sent to the Electronic Brake Control Module which will supply 12 V to the apply control circuits and ground to the release control circuits which will cause the left and

right park brake actuators to activate causing the park brakes to engage. When the Park Brake Switch is pressed, a signal is sent to the Electronic Brake Control Module which will supply 12 V to the released control circuits and ground to the apply control circuits which will cause the left and right park brake actuators to activate causing the park brakes to release.

Conditions for Running the DTC

- Vehicle ON or in SERVICE MODE.
- Battery voltage is between 9 - 16 V

Conditions for Setting the DTC

The Electronic Brake Control Module detects a malfunction in the left park brake actuator or its circuits.

Action Taken When the DTC Sets

- The parking brake is disabled, one release allowed.
- A message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

- The Electronic Brake Control Module will clear the DTC after 40 consecutive ignition on/off cycles with at least one test pass in each ignition cycle and no test fail result.
- The condition for the DTC is no longer present.

Diagnostic Aids

After repairing any fault, the DTC will still be set as current and the park brakes will not function. It is necessary to clear the DTC with a scan tool in order to place the DTC in history and regain park brake function.

Circuit/System Verification

1. Verify the M104L Park Brake Actuator - Left apply when pulling the S91 Park Brake Switch.
 - **If the M104L Park Brake Actuator - Left does not apply**

Refer to the Circuit/System Testing.
 - **If the M104L Park Brake Actuator - Left does apply**
2. Verify the M104L Park Brake Actuator - Left release when pressing the S91 Park Brake Switch.
 - **If the M104L Park Brake Actuator - Left does not release**

Refer to the Circuit/System Testing.
 - **If the M104L Park Brake Actuator - Left does release**
3. All OK.

Circuit/System Testing

NOTE: **It is necessary to clear the DTC after any repair is made to regain park brake output control and have the DTC to set as history.**

1. Ignition OFF, disconnect the harness connector at the M104L Park Brake Actuator - Left and the harness connector at the K17 Electronic Brake Control Module. Ignition ON
2. Test for less than 1 V between the K17 Electronic Brake Control Module harness connector terminals listed below and ground:
 - Terminal 12
 - Terminal 13
 - **If 1 V or greater**

Repair the short to voltage on the circuit.
 - **If less than 1 V**
3. Ignition OFF.
4. Test for infinite resistance between the K17 Electronic Brake Control Module harness connector terminals listed below and ground:
 - Terminal 12
 - Terminal 13
 - **If less than infinite resistance**

Repair the short to ground on the circuit.
 - **If infinite resistance**
5. Test for less than 2 Ω between the M104L Park Brake Actuator - Left harness connector terminal 1 and

the K17 Electronic Brake Control Module harness connector terminal 13

- **If 2 Ω or greater**

Repair the open/high resistance in the circuit.

- **If less than 2 Ω**

6. Test for less than 2 Ω between the M104L Park Brake Actuator - Left harness connector terminal 2 and the K17 Electronic Brake Control Module harness connector terminal 12

- **If 2 Ω or greater**

Repair the open/high resistance in the circuit.

- **If less than 2 Ω**

7. Install a 25 A fused jumper wire between one of the control terminals at the M104L Park Brake Actuator - Left and 12 V. Momentarily install a jumper wire between the other control terminal and ground. Reverse the jumper wires at least two times, the M104L Park Brake Actuator - Left should perform the apply and release function.

- **If the actuator does not perform the apply and release function**

Replace the M104L Park Brake Actuator - Left.

- **If the actuator performs the apply and release function**

8. Replace the K17 Electronic Brake Control Module.

Circuit/System Description

The parking brake function is integrated into the Electronic Brake Control Module. The Electronic Brake Control Module contains the logic for applying and releasing the parking brake when commanded by the Park Brake Switch. The Electronic Brake Control Module will perform diagnostics on the Park Brake Switch and its wiring harness to verify it is functioning properly.

The Park Brake Switch diagnostic checks for failure conditions in the Park Brake Switch and associated wiring into the Electronic Brake Control Module.

Conditions for Running the DTC

Vehicle ON or in SERVICE MODE.

Conditions for Setting the DTC

The Electronic Brake Control Module detects a short to battery, short to ground, open circuit, or an internal Parking Brake Control Switch malfunction. The Electronic Brake Control Module detects the apply or release button was activated for more than 90 s.

Action Taken When the DTC Sets

- The parking brake is disabled.
- A message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

- The Electronic Brake Control Module will clear the DTC after 40 consecutive Vehicle on/off cycles with at least one test pass in each Vehicle cycle and no test fail result.
- The condition for the DTC is no longer present.
- The Park Brake Switch button is INACTIVE using the scan tool without the switch being activated.

Circuit/System Verification

1. Vehicle ON.
2. Verify the scan tool Park Brake Switch parameter changes between Released and Apply while pressing and releasing the S91 Park Brake Switch.
 - **If the parameter does not change**

Refer to Circuit/System Test.
 - **If the parameter changes**
3. All OK.

Circuit/System Test

1. Vehicle OFF, disconnect the harness connector at the K17 Electronic Brake Control Module. Vehicle ON.
2. Test for less than 1 V between each circuit terminals listed below and ground;
 - Terminal 16
 - Terminal 32
 - Terminal 9
 - Terminal 15
 - Terminal 31
 - Terminal 8
 - **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

3. Vehicle OFF.

4. Test for infinite resistance between the circuit terminals listed below and ground;

- Terminal 16
- Terminal 32
- Terminal 9
- Terminal 15
- Terminal 31
- Terminal 8

- **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

5. Test for less than 5 Ω between the circuit terminal 32 and the circuit terminal 31.

- **If 5 Ω or greater**

1. Vehicle OFF, disconnect the harness connector at the S91 Park Brake Switch.

2. Test for less than 2 Ω in the circuits end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the S91 Park Brake Switch.

- **If less than 5 Ω**

6. Test for less than 5 Ω between the circuit terminal 8 and the circuit terminal 15.

- **If 5 Ω or greater**

1. Vehicle OFF, disconnect the harness connector at the S91 Park Brake Switch.

2. Test for less than 2 Ω in the circuits end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the S91 Park Brake Switch.

- **If less than 5 Ω**

7. Test for less than 5 Ω between the circuit terminal 16 and the circuit terminal 9.

- **If 5 Ω or greater**

1. Vehicle OFF, disconnect the harness connector at the S91 Park Brake Switch.

2. Test for less than 2 Ω in the circuits end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the S91 Park Brake Switch.

- **If less than 5 Ω**

8. Test for less than 5 Ω between the circuit terminal 9 and the circuit terminal 31 while closing the switch.

- **If 5 Ω or greater**

Replace the S91 Park Brake Switch.

- **If less than 5 Ω**

9. Test for less than 5 Ω between the circuit terminal 9 and the circuit terminal 15 while closing the switch.

- **If 5 Ω or greater**

Replace the S91 Park Brake Switch.

- **If less than 5 Ω**

10. Vehicle OFF, all access doors closed, all vehicle systems OFF, disconnect the harness connector at the S91 Park Brake Switch.

11. Test for less than 10 Ω between the ground circuit terminal 8 at the S91 Park Brake Switch and ground.

- **If 10 Ω or greater**

1. Vehicle OFF.

2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 10 Ω**

12. Replace the S91 Park Brake Switch.

13. Verify that DTC C114C does not set while operating the vehicle within the Conditions for Running the DTC.

- **If the DTC sets**

Replace the K17 Electronic Brake Control Module.

- **If DTC does not set**

14. All OK.

DTC C1586: RIGHT PARK BRAKE ACTUATOR CIRCUIT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provide an overview of each diagnostic category.

DTC Descriptors

DTC C1586

Right Park Brake Actuator Circuit

For symptom byte information, refer to: [Symptom Byte List](#)

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Right Park Brake Actuator Apply Control	C1586 0C	C1586 04	C1586 0B	C1586 00 C1586 0F
Right Park Brake Actuator Release Control	C1586 0C	C1586 04	C1586 0B	C1586 00 C1586 0F

Circuit/System Description

The Electronic Brake Control Module will diagnose the park brake motor circuits to verify that they are functioning properly. The park brake motor circuits are used to command actuator motor operation, which will apply and release the parking brake. These circuits are used to activate the actuator, which applies or releases pressure on the rear caliper pistons, ultimately applying and releasing the park brake.

When the Park Brake Switch is pulled, a signal is sent to the Electronic Brake Control Module which will supply 12 V to the apply control circuits and ground to the release control circuits which will cause the left and right park brake actuators to activate causing the park brakes to engage. When the Park Brake Switch is pressed, a signal is sent to the Electronic Brake Control Module which will supply 12 V to the released control circuits and ground to the apply control circuits which will cause the left and right park brake actuators to activate causing the park brakes to release.

Conditions for Running the DTC

- Vehicle ON or in SERVICE MODE.
- Battery voltage is between 9 - 16 V

Conditions for Setting the DTC

The Electronic Brake Control Module detects a malfunction in the right park brake actuator or its circuits.

Action Taken When the DTC Sets

- The parking brake is disabled, one release allowed.
- A message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

- The Electronic Brake Control Module will clear the DTC after 40 consecutive ignition on/off cycles with at least one test pass in each ignition cycle and no test fail result.
- The condition for the DTC is no longer present.

Diagnostic Aids

After repairing any fault, the DTC will still be set as current and the park brakes will not function. It is necessary to clear the DTC with a scan tool in order to place the DTC in history and regain park brake function.

Circuit/System Verification

1. Verify the M104R Park Brake Actuator - Right apply when pulling the S91 Park Brake Switch.
 - **If the M104R Park Brake Actuator - Right does not apply**
Refer to the Circuit/System Testing.
 - **If the M104R Park Brake Actuator - Right does apply**
2. Verify the M104R Park Brake Actuator - Right release when pressing the S91 Park Brake Switch.
 - **If the M104R Park Brake Actuator - Right does not release**
Refer to the Circuit/System Testing.
 - **If the M104R Park Brake Actuator - Right does release**
3. All OK.

Circuit/System Testing

NOTE: It is necessary to clear the DTC after any repair is made to regain park brake output control and have the DTC to set as history.

1. Ignition OFF, disconnect the harness connector at the M104R Park Brake Actuator - Right and the harness connector at the K17 Electronic Brake Control Module. Ignition ON
2. Test for less than 1 V between the K17 Electronic Brake Control Module harness connector terminals listed below and ground:
 - Terminal 2

- Terminal 3
- **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

3. Ignition OFF.

4. Test for infinite resistance between the K17 Electronic Brake Control Module harness connector terminals listed below and ground:

- Terminal 2
- Terminal 3
- **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

5. Test for less than 2 Ω between the M104R Park Brake Actuator - Right harness connector terminal 1 and the K17 Electronic Brake Control Module harness connector terminal 2

- **If 2 Ω or greater**

Repair the open/high resistance in the circuit.

- **If less than 2 Ω**

6. Test for less than 2 Ω between the M104R Park Brake Actuator - Right harness connector terminal 2 and the K17 Electronic Brake Control Module harness connector terminal 3

- **If 2 Ω or greater**

Repair the open/high resistance in the circuit.

- **If less than 2 Ω**

7. Install a 25 A fused jumper wire between one of the control terminals at the M104R Park Brake Actuator - Right and 12 V. Momentarily install a jumper wire between the other control terminal and ground.

Reverse the jumper wires at least two times, the M104R Park Brake Actuator - Right should perform the apply and release function.

- **If the actuator does not perform the apply and release function**

Replace the M104R Park Brake Actuator - Right.

- **If the actuator performs the apply and release function**

8. Replace the K17 Electronic Brake Control Module.

SYMPTOMS - PARK BRAKE

NOTE: Review the system operation in order to familiarize yourself with the system functions.

Refer to **Park Brake System Diagnosis**.

1. Inspect for aftermarket devices which could affect the operation of the park brake system.
2. Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
3. Listen to working noise in both parking brake actuators during pushing the parking brake indicator switch.

If no noises occur, check the fuse.

4. Perform a test with a scan tool.

PARK BRAKE WILL NOT HOLD OR RELEASE

Step	Action	Yes	No
1	Were you sent here from the Park Brake Symptom Table?	Go to Step 2	Go to Symptoms - Park Brake
2	Inspect the park brake system for proper operation. Refer to Park Brake System Diagnosis . Did you find and correct a condition?	Go to Step 4	Go to Step 3
3	Inspect the disc brake system for proper operation. Refer to Disc Brake System Diagnosis . Did you find and correct a condition?	Go to Step 4	Go to Symptoms - Park Brake
4	Road test the vehicle in order to confirm proper operation. Refer to Brake System Vehicle Road Test . Is the condition still present?	Go to Step 2	System OK

PARK BRAKE SYSTEM DIAGNOSIS

Step	Action	Yes	No
DEFINITION: This diagnostic table is designed to diagnose ONLY the components of the PARK brake system in order to determine if the PARK brake system is operating properly. You will be directed by the appropriate Symptom Table to go to other brake system diagnostic tables as appropriate.			
1	1. Raise and support the vehicle with the rear axle supported by jack stands. Lifting and Jacking the Vehicle . 2. Shift the transmission into NEUTRAL. 3. With the park brake RELEASED, attempt to rotate the rear wheels to check the rear brakes for a significant amount of drag. Do the rear brakes have a significant amount of drag?	Go to Step 4	Go to Step 2
2	1. Shift the transmission into NEUTRAL. 2. Apply the park brake. 3. Attempt to rotate the rear wheels to check the rear brakes for a significant amount of drag. Do the rear brakes have a significant amount of drag?	Go to Step 4	Go to Step 3

Step	Action	Yes	No
3	Do the electronic park brake actuators working?	Go to Step 10	Go to Step 5
4	Calibrate the park brake. <u>Park Brake Calibration</u> Do the rear brakes have a significant amount of drag?	Go to Step 5	Go to Step 10
5	1. Check the fuse of the electronic park brake. 2. Check visual the electronic park brake actuators, the wiring harness and the electrical connectors. 3. Check visual the electronic brake control module, the wiring harness and the electrical connector. 4. Check the electronic park brake system with a scan tool. Did you find the condition?	Go to Step 6	Go to Step 7
6	• Replace the fuse as necessary. • Replace the wiring harness as necessary. • Replace the park brake actuator switch as necessary. <u>Parking Brake Actuator Switch Replacement</u> • Replace the parking brake actuators as necessary. <u>Rear Parking Brake Actuator Replacement</u> Did you correct the condition?	Go to Step 9	Go to Step 6
7	CAUTION: Do not depress the brake pedal with the brake rotors and/or the brake drums removed, or with the brake calipers repositioned away from the brake rotors, or damage to the brake system may result.	Go to Step 8	Go to Step 10

Step	Action	Yes	No
	1. Remove the rear disc brake pads. Rear Disc Brake Pads Replacement . 2. Inspect the disc brake pads for looseness, damaged, broken or missing components. 3. Check the brake caliper piston seals for cracks. 4. Check the brake caliper pistons for movement 5. Check the electronic park brake actuators for a seized condition. Does the park brake hardware and/or the park brake actuators require replacement?		
8	1. Replace the rear brake hardware components as necessary. Rear Disc Brake Pads Replacement 2. Replace the rear brake calipers as necessary. Rear Brake Caliper Replacement Did you complete the replacement?	Go to Step 9	-
9	1. Calibrate the electronic brake system. Park Brake Calibration Did you complete the replacement and adjustment?	Go to Step 10	Go to Symptoms - Park Brake
10	Install or connect any components that were removed or disconnected during diagnosis. Did you complete the operation?	Park Brake System OK	Go to Symptoms - Park Brake

REPAIR INSTRUCTIONS

PARK BRAKE CALIBRATION

1. Block the drive wheels.
2. Install a scan tool to the vehicle.
3. Turn the ignition switch to the ON/RUN position with the engine OFF.
4. Select Configuration/Reset Functions from the electronic brake control module menu.
5. Perform the parking brake calibration procedure.

PARKING BRAKE ACTUATOR SWITCH REPLACEMENT

Removal Procedure

1. Remove [Front Floor Console Accessory Trim Plate Replacement](#)

Fig. 2: Electrical Connector And Parking Brake Switch

Courtesy of GENERAL MOTORS COMPANY

2. Disconnect Electrical Connector (2) @Parking Brake Switch (1)
3. Remove Parking Brake Switch (1)

Installation Procedure

Fig. 3: Electrical Connector And Parking Brake Switch

Courtesy of GENERAL MOTORS COMPANY

1. Install Parking Brake Switch (1)
2. Connect Electrical Connector (2) @Parking Brake Switch (1)
3. Install **Front Floor Console Accessory Trim Plate Replacement**

REAR PARKING BRAKE ACTUATOR REPLACEMENT

Removal Procedure

WARNING: Brake Fluid Irritant Warning

WARNING: Use of eye goggles is necessary to prevent personal injury.

CAUTION: Brake Fluid Effects on Paint and Electrical Components Caution

1. Set the parking brake in service mode. With Scan Tool.
 1. Connect the scan tool.
 2. Ignition ON, engine OFF.
 3. Select Electronic Brake Control Module.
 4. Select Control Functions.

NOTE: Do not apply any brake pressure during the following step.

5. Select Rear Brake Caliper Piston Retract.
2. Turn OFF the ignition.
3. Raise and support the vehicle. Lifting and Jacking the Vehicle .
4. Remove the rear tire and wheel assemblies. Tire and Wheel Removal and Installation .

Fig. 4: Brake Hose, Fitting Bolt And Sealing Washers

Courtesy of GENERAL MOTORS COMPANY

5. Remove Brake Hose Fitting Bolt (1) @Rear Brake Caliper
6. Remove Brake Hose (2) @Rear Brake Caliper
7. Cap the brake caliper inlet port to prevent brake fluid loss and contamination.
8. Cap the brake hose fitting to prevent brake fluid loss and contamination.
9. DISCARD the brake hose fitting gaskets. (3)

Fig. 5: Brake Caliper Assembly And Lectrical Connector

Courtesy of GENERAL MOTORS COMPANY

10. Disconnect the electrical connector (1) and remove the wiring harness from the brake caliper assembly (2).

Installation Procedure

Fig. 8: Seal Ring And Rear Brake Caliper

Courtesy of GENERAL MOTORS COMPANY

NOTE: The seating faces between actuator and housing must be free of scratches and clean.

1. Install a NEW O-ring seal.(1)

Fig. 9: Parking Brake Actuator

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Fastener Caution

2. Install Bolt (2) @Parking Brake Actuator (1) and tighten 12 N.m (106 lb in)

Fig. 10: Brake Caliper Assembly And Lectrical Connector

Courtesy of GENERAL MOTORS COMPANY

3. Connect the electrical connector (1) and fix the wiring harness with 2 cable straps to the brake caliper assembly (2).
4. Remove the caps from the brake caliper opening and the brake hose.

Fig. 11: Brake Hose, Fitting Bolt And Sealing Washers

Courtesy of GENERAL MOTORS COMPANY

5. Install NEW brake hose fitting gaskets. (3)
6. Install Brake Hose Fitting Bolt (1) @Rear Brake Caliper and tighten 40 N.m (30 lb ft)
7. Bleed the brake system. [Hydraulic Brake System Bleeding](#)
8. Install the rear tire and wheel assemblies. [Tire and Wheel Removal and Installation](#) .
9. Remove the support and lower the vehicle.
10. With the engine OFF, gradually apply the brake pedal to approximately 2/3 of its travel distance.
11. Slowly release the brake pedal.
12. Wait 15 seconds, then repeat step 10 and 11 until a firm brake pedal is obtained.
13. [Park Brake Calibration](#)

REAR PARKING BRAKE SERVICE MODE SELECTION

Rear Parking Brake Actuator Release - Service Mode

Prior to any rear disc brake or parking brake service, the parking brake actuator must be placed in Service Mode.

1. Install a scan tool to the vehicle.
2. Turn the ignition ON with the engine OFF.
3. On the scan tool menu, select Electronic Brake Control Module.
4. Select Control Functions.

NOTE: Do NOT apply any brake pedal pressure during this step.

5. Select Rear Brake Caliper Piston Retract.
6. After the repair is complete, calibrate the park brake. [Park Brake Calibration](#)

Rear Parking Brake Actuator Release - Manual Release

In the event the rear parking brake actuator fails or there is a loss of electrical power, the parking brake may be released manually.

1. Remove the rear parking brake actuator. [Rear Parking Brake Actuator Replacement](#)
2. Insert an appropriate hex tool past the splines of the parking brake actuator piston apply spindle in the brake caliper.
3. Rotate the parking brake actuator piston apply spindle clockwise to release the parking brake.
4. After the repair is complete, calibrate the park brake. [Park Brake Calibration](#)

DESCRIPTION AND OPERATION

ELECTRONIC PARKING BRAKE DESCRIPTION

Vehicles with the electric parking brake have a switch in the center console or on the dash, which takes the place of the manual parking brake system, the foot pedal and release handle. In case of insufficient electrical power, the electric parking brake cannot be applied or released.

Electronic Brake Control Module

The parking brake function is integrated into the Electronic Brake Control Module. The Electronic Brake Control Module contains the logic for applying and releasing the parking brake when commanded by the Park Brake Switch.

When the Park Brake Switch is pulled, a signal is sent to the Electronic Brake Control Module which will supply 12 V to the apply control circuits and ground to the release control circuits which will cause the left and right park brake actuators to activate causing the park brakes to engage. When the Park Brake Switch is pressed, a signal is sent to the Electronic Brake Control Module which will supply 12 V to the released control circuits and ground to the apply control circuits which will cause the left and right park brake actuators to activate causing the park brakes to release.

The Electronic Brake Control Module will diagnose the park brake motor circuits to verify that they are functioning properly. The park brake motor circuits are used to command actuator motor operation, which will apply and release the parking brake. These circuits are used to activate the actuator, which applies or releases pressure on the rear caliper pistons, ultimately applying and releasing the park brake.

The Park Brake Motor Position Sensor is an internal sensor to the park brake actuator, this sensor is used to monitor the park brake motor position.

Electric Parking Brake Apply

The electric parking brake can be applied any time the vehicle is stopped or in motion. The electric parking brake is applied by momentarily lifting up on the park brake control switch. The red park brake light will momentarily flash while the parking brake is being applied. Once fully applied, the red park brake light will turn on. If the electric parking brake is applied while the vehicle is in motion, a chime will sound, and the message "Release Park Brake Switch" will be displayed.

If the red park brake light is flashing, the electric parking brake is only partially applied or released, or there is a problem with the electric parking brake. The message "Service Park Brake" will be displayed.

The vehicle may automatically apply the electric parking brake in some situations when the vehicle is not moving. This is normal, and is done to periodically check the correct operation of the electric parking brake system.

Electric Parking Brake Release

To release the electric parking brake, turn the ignition switch to the ON or RUN position, apply and hold the brake pedal, and push down momentarily on the park brake control switch. When the electric parking brake is released the red park brake light turns off.

The electric parking brake can be used to prevent roll back for vehicles with a manual transmission taking off on a hill. In a situation where no roll back is desired, an applied electric parking brake will allow both feet to be used for the clutch and accelerator pedals in preparation for starting the vehicle moving in the intended direction. In this situation, perform the normal clutch and accelerator actions required to begin moving the vehicle. There is no need to push the switch to release the electric parking brake. To disable this feature lift and hold the park brake control switch while the vehicle is in motion, this will keep the electric parking brake applied.

PARK BRAKE SYSTEM DESCRIPTION AND OPERATION

Electronic Park Brake System

By pushing the parking brake switch, the actuators on each rear disc brake caliper will be activated and the rear brake caliper pistons apply pressure to the rear disc brake rotors until the rear tire and wheel assemblies are locked. A red brake lamp shows the status of the activated parking brake and is illuminating during the On position of the ignition switch.

By pressing the parking brake switch a second time, the electronic parking brake will release and the red brake lamp go out.

Non mechanical problems with the electronic parking brake system can be localized with a scan tool.

Service

Before a repair service procedure on the rear brakes is carried out, the electronic parking brake system has to be set in a service mode. After the repair service procedure of the rear disc brakes, the electronic parking brake system has to be calibrated before the vehicle can leave the workshop. The rotation of the rear brake caliper piston of a brake caliper equipped with an electronic parking brake system is not allowed. The rear brake caliper piston can be retracted by pressing in the caliper bore with a suitable tool.

<u>DTC P0420</u>	Catalyst System Low Efficiency
<u>DTC P043E, P043F, or P145F</u>	Evaporative Emission (EVAP) System Reference
<u>DTC P0442 or P0455</u>	Evaporative Emission (EVAP) System

DTC	Description
<u>DTC P0443, P0458, or P0459</u>	Evaporative Emission (EVAP) Purge Solenoid Valve Control

**ENGINE CONTROLS / FUEL - 1.5L (L3A) - DIAGNOSTIC TROUBLE CODE (DTC)
IDENTIFICATION (2 OF 2)**

DTC	Description
<u>DTC P0446</u>	Evaporative Emission (EVAP) Vent System Performance
<u>DTC P0449, P0498, or P0499</u>	Evaporative Emission (EVAP) Vent Solenoid Valve Control
<u>DTC P0451, P0453</u>	Fuel Tank Pressure Sensor
<u>DTC P0497</u>	Evaporative Emission (EVAP) System No Flow During Purge
<u>DTC P050D</u>	Cold Start Rough Idle
<u>DTC P057B, P057E</u>	Brake Pedal Position Sensor
<u>DTC P0601, P0604, P0606, P062B, P062F, P0630, P16F3, or P262B</u>	Control Module Performance
<u>DTC P0627, P0629</u>	Fuel Pump Enable Circuit
<u>DTC P0641, P0651, P0697, P06A3, or P06D2</u>	5 V Reference Circuit
<u>DTC P0650, P263A, or P263B</u>	Malfunction Indicator Lamp (MIL) Control
<u>DTC P0685, P0690, P1682, P16A7, P16AF, or P16B3</u>	Engine Controls Ignition Relay/Ignition 1 Switch Circuit 2
<u>DTC P06E4</u>	Control Module Wake-Up Circuit Performance (ECM)
<u>DTC P1101</u>	Intake Air Flow System Performance
<u>DTC P111E</u>	Engine Coolant Temperature Sensor Not Plausible
<u>DTC P1255</u>	Fuel Pump Control Module Driver High Temperature
<u>DTC P127C, P128A, P128D, P128F, P16E4, or P16E5</u>	Fuel Rail Pressure Sensor/Sensor Communication Circuit
<u>DTC P129E or P12A8</u>	Fuel Pump Control Signal Message Counter Incorrect
<u>DTC P129B or P129C</u>	Fuel Pump Driver Control Module System
<u>DTC P129D</u>	Fuel Pump Driver Control Module Ignition On/Start Switch Circuit Low Voltage
<u>DTC P12A6</u>	Fuel Pump Driver Control Module Enable Circuit Performance
<u>DTC P135A</u>	Ignition Coil Supply Voltage Circuit Bank 1
<u>DTC P1400</u>	Cold Start Emission Reduction Control System
<u>DTC P145C or P145D</u>	Evaporative Emission (EVAP) System
<u>DTC P145E</u>	Evaporative Emission (EVAP) System Leak Detection Pump to Vent Solenoid Valve Leak Detected

DTC	Description
<u>DTC P1461</u>	Evaporative Emission (EVAP) System Pressure Incorrect During Fuel Fill Door Open Request
<u>DTC P1462</u>	Evaporative Emission (EVAP) System Reference Orifice Flow Erratic
<u>DTC P1426</u>	Exhaust Gas Recirculation (EGR) Valve Internal Performance
<u>DTC P1427, P142A or P1437</u>	EGR Temperature Sensor
<u>DTC P1516, P2101, P2119, or P2176</u>	Throttle Actuator Control (TAC) Module Throttle Actuator Position Performance
<u>DTC P15F2</u>	Engine Torque Command Signal Message Counter Incorrect
<u>DTC P15F9</u>	Hybrid/EV System Engine Speed Control Intervention Request Type Signal Message Counter Incorrect
<u>DTC P15FB</u>	Brake Pedal Position Sensor Signal Message Counter Incorrect
<u>DTC P162D</u>	Evaporative Emission (EVAP) System Alarm Clock Signal Not Received
<u>DTC P163A</u>	Control Module Fuel Pressure Regulator 1 Control System Circuitry Performance
<u>DTC P2096 or P2097</u>	Post Catalyst Fuel Trim System
<u>DTC P2122, P2123, P2127, P2128, or P2138</u>	Accelerator Pedal Position (APP) Sensor
<u>DTC P2199</u>	Intake Air Temperature (IAT) Sensor 1-2 Not Plausible
<u>DTC P219A</u>	Fuel Trim Cylinder Balance
<u>DTC P2227, P2230</u>	Barometric Pressure (BARO) Sensor
<u>DTC P2400, P2402</u>	Evaporative Emission (EVAP) System Leak Detection Pump
<u>DTC P2418, P2420</u>	Evaporative Emission (EVAP) System Leak Detection Pump Switching Valve Control Circuit
<u>DTC P2422</u>	Evaporative Emission (EVAP) Vent Solenoid Valve Stuck Closed
<u>DTC P2450</u>	Evaporative Emission (EVAP) System Leak Detection Pump Switching Valve Performance
<u>DTC P2457</u>	Exhaust Gas Recirculation (EGR) Cooler Low Efficiency
<u>DTC P24B9, P24BB</u>	Evaporative Emission (EVAP) System Leak Detection Pump Pressure Sensor
<u>DTC P2618</u>	Crankshaft Position Signal Output Circuit Low Voltage
<u>DTC P2635</u>	Fuel Pump Flow Performance

ENGINE COOLING SYSTEM - DTCS

ENGINE COOLING SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
<u>DTC P00B3 or P00B4</u>	Radiator Coolant Temperature (RCT) Sensor Circuit Low/High Voltage
<u>DTC P00B7</u>	Engine Coolant Flow Insufficient
<u>DTC P0597, P0599</u>	Engine Coolant Thermostat Heater Control Circuit
<u>DTC P112F</u>	Radiator Coolant Temperature Sensor Not Plausible
<u>DTC P1485, P1487</u>	Cooling Fan Output Circuit
<u>DTC P2181</u>	Engine Cooling System Performance

ENGINE MECHANICAL - 1.5L (L3A) - DTCS

ENGINE MECHANICAL - 1.5L (L3A) - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
<u>DTC P06DA, P06DE</u>	Engine Oil Pressure Control Solenoid Valve

FIXED AND MOVEABLE WINDOWS - DTCS

FIXED AND MOVEABLE WINDOWS - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
<u>DTC B0283</u>	Rear Defogger Circuit
<u>DTC B316B, B317A, B318A, or B319A</u>	Window Switch
<u>DTC B3205</u>	Driver Window Motor

HORN SYSTEM - DTCS

HORN SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
<u>DTC B010E</u>	Pedestrian Friendly Alert Audio Output Circuit
<u>DTC B274E or B274F</u>	Low Note Horn Relay Control Circuit

HVAC SYSTEM - AUTOMATIC - DTCS

HVAC SYSTEM - AUTOMATIC - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
<u>DTC B0163</u>	Passenger Compartment Temperature Sensor Circuit
<u>DTC B0173 or B0178</u>	Upper Left Duct Air Temperature Sensor Circuit/Lower Left Duct Air Temperature Sensor Circuit
<u>DTC B018A, B048C, B048F, or B1395</u>	Windshield Temperature Sensor Circuit/Humidity Sensor Humidity Circuit/Humidity Sensor Temperature Circuit/Control Module Voltage Reference Output Circuit Voltage
<u>DTC B0183</u>	Solar Load Sensor Circuit

DTC	Description
<u>DTC B0193</u>	Front Blower Motor Speed Circuit
<u>DTC B0223, B0233, B023A, or B0408</u>	Recirculate Position Command 1 Circuit/Air Flow Control Circuit/HVAC Actuators Supply Voltage/Main Temperature Control Circuit
<u>DTC B048E</u>	Auxiliary Heater System
<u>DTC B3844</u>	Engine Coolant Circulation Pump Circuit
<u>DTC P0531, P0532, or P0533</u>	Air Conditioning (A/C) Refrigerant Pressure Sensor
<u>DTC P0534</u>	Air Conditioning (A/C) Refrigerant Charge Low
<u>DTC P0D69, P0D7F</u>	A/C Compressor Motor Voltage Sensor/Electric A/C Compressor Control Module Internal Temperature Sensor/Electric A/C Compressor Control Module Output Driver Temperature Sensor
<u>DTC P151C or P2516, P2518</u>	Air Conditioning (A/C) Refrigerant Low Side Pressure Sensor
<u>DTC P154F</u>	Electric A/C Compressor motor Input Current-Positive Contactor State Not Plausible
<u>DTC P156A, P156C</u>	Air Conditioning (A/C) Pressure Too High when A/C Off/Air Conditioning (A/C) Pressure Too Low when A/C On
<u>DTC P15C6 or P15C8, P15CB</u>	Electric A/C Compressor Speed Request Signal Message Counter Incorrect/Electric A/C Compressor Data Message Counter Incorrect/Electric A/C Compressor Status Message Counter Incorrect/Electric A/C Compressor Sensors Signal Message Counter Incorrect/Electric A/C Compressor Sensors Status Message Counter Incorrect
<u>DTC P1F0A, P1F0D</u>	A/C Compressor Motor Speed Performance/A/C Compressor Motor Start-Up Current Performance/Electric A/C Compressor Control Module A/C Compressor Motor Current Feedback Circuit Voltage
<u>DTC P15C5, P2682, P2683, P26A5, P26A7, P26A9, P26AD, or P26AE</u>	Engine Coolant Bypass Valve Position Sensor/Engine Coolant Bypass Valve Control Circuits

HYBRID / EV CONTROL SYSTEM - DTCS

HYBRID / EV CONTROL SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
<u>DTC P0335 or P0336</u>	Crankshaft Position Sensor
<u>DTC P0506 or P0507</u>	Idle Speed Low/High
<u>DTC P0601, P0604, P0606, P062F, P1EB6, or P1EB7</u>	Control Module (Hybrid/EV Powertrain Control Module 1)
<u>DTC P061A or P061B</u>	Control Module Torque System

DTC	Description
<u>DTC P06AF</u>	Torque Management System Performance - Forced Engine Shutdown
<u>DTC P06B1, P06B2, P06B4, P06B5, P06E7, or P06E8</u>	Sensor Supply Voltage
<u>DTC P0A1B or P0A1C</u>	Drive Motor Control Module Performance
<u>DTC P0A3E, P0A40, P0C52, P0C53, P0C5C, P0C5D, or P1B03</u>	Drive Motor 1 Position Sensor
<u>DTC P0A45, P0A46, P0C57, P0C58, P0C61, P0C62, or P1B04</u>	Drive Motor Position Sensor
<u>DTC P0A5E, P0A61, P0A64, P0A67, P0A6A, or P0A6D</u>	Drive Motor Phase
<u>DTC P0A78 or P0A79</u>	Drive Motor Inverter Performance
<u>DTC P0AB9</u>	Hybrid/EV System Performance
<u>DTC P0AEE, P0AEF, P0AF0, P0AF3, P0AF5, P0BD2-P0BD4, P0BD7-P0BD9, P0BDC-P0BDE, or P0BE1-P0BE3</u>	Drive Motor Inverter Temperature Sensor
<u>DTC P0B01, P0B04, or P0B07</u>	Auxiliary Transmission Fluid Pump Low Current
<u>DTC P0BE6, P0BE8, P0BEA-P0BEC, P0BEE, P0BEF, P0BF0, P0BF2-P0BF4, P0BF6-P0BF8, or P0BFA-P0BFC</u>	Drive Motor
<u>DTC P0BFD or P0BFE</u>	Drive Motor Phases U-V-W Not Plausible
<u>DTC P0C01 or P0C04</u>	Drive Motor High Current
<u>DTC P0C0B or P0C0E</u>	Drive Motor Inverter Supply Voltage Circuit
<u>DTC P0C11, P0C16</u>	Drive Motor Inverter Phase
<u>DTC P0C17, P0C18, P1B0E, or P1B10</u>	Drive Motor Position
<u>DTC P0C19</u>	Drive Motor 1 Torque Delivered Performance
<u>DTC P0C1A</u>	Drive Motor 2 Torque Delivered Performance
<u>DTC P0C28</u>	Auxiliary Transmission Fluid Pump High Current
<u>DTC P0C4E</u>	Drive Motor 1 Position Exceeded Learning Limit
<u>DTC P0C4F</u>	Drive Motor 2 Position Exceeded Learning Limit
<u>DTC P0C76</u>	Hybrid/EV Battery System High Voltage Present
<u>DTC P150D or P150E</u>	Supply Voltage Circuit
<u>DTC P15F0</u>	Engine Torque Delivered Signal Message Counter Incorrect
<u>DTC P15F1</u>	Axle Torque Request Signal Message Counter Incorrect
<u>DTC P15F2</u>	Engine Torque Command Signal Message Counter Incorrect
<u>DTC P15FC</u>	Hybrid/EV Battery Contactor Status Message Counter Incorrect
<u>DTC P16E0</u>	Engine Performance - No Torque Detected

DTC	Description
<u>DTC P16F3</u>	Control Module Redundant Memory Performance (Hybrid/EV Powertrain Control Module 1)
<u>DTC P16F4</u>	Control Module Transmission Range Switch (Hybrid/EV Powertrain Control Module 1)
<u>DTC P16F6</u>	Control Module Transmission Range Calculation Performance (Hybrid/EV Powertrain Control Module 1)
<u>DTC P179A</u>	Auxiliary Transmission Fluid Pump Overspeed
<u>DTC P190A, P190F</u>	Drive Motor Inverter Phase
<u>DTC P1A4E, P1A50, P1A54, P1ADC, or P1ADD</u>	Drive Motor Control Module
<u>DTC P1ADE, P1ADF, P1AE0, or P1AE1</u>	Drive Motor Control Module System
<u>DTC P1AEE or P1AEF</u>	Drive Motor Control Module Hybrid/EV Battery System Voltage High Voltage
<u>DTC P1AF0 or P1AF2</u>	Drive Motor Control Module Hybrid/EV Battery Voltage System Isolation Lost
<u>DTC P1AF4, P1AF7</u>	Drive Motor Control Module Hybrid/EV Battery Voltage Isolation Sensing Circuit
<u>DTC P1B0B or P1B0C</u>	Drive Motor 1 Control Module Hybrid/EV Battery Voltage Isolation Sensing Circuit
<u>DTC P1B0D or P1B0E</u>	Drive Motor Control Module Drive Motor Overspeed
<u>DTC P1B15</u>	Regenerative Braking Torque Request Signal Message Counter Incorrect
<u>DTC P1B41 or P1B42</u>	Drive Motor Control Module Hybrid/EV Battery Voltage Isolation Sensing Performance
<u>DTC P1B43 or P1B44</u>	Drive Motor Control Module Hybrid/EV Battery Voltage Isolation Sensing Circuit
<u>DTC P1E0A or P1E0B</u>	Drive Motor Control Module Torque Calculation Performance
<u>DTC P1E1B, P1E1F</u>	Auxiliary Transmission Fluid Pump Control Module Hybrid/EV Battery Voltage Isolation Sensing Circuit
<u>DTC P1E22</u>	Auxiliary Transmission Fluid Pump Control Module Hybrid/EV Battery Voltage System Isolation Lost
<u>DTC P1E29</u>	Auxiliary Transmission Fluid Pump Control Module Calculated Motor Position Performance
<u>DTC P1E2A, P1E2F</u>	Auxiliary Transmission Fluid Pump Phase
<u>DTC P1E34, P1E36</u>	Auxiliary Transmission Fluid Pump Inverter Temperature Sensor
<u>DTC P1E37</u>	Auxiliary Transmission Fluid Pump Inverter High Temperature
<u>DTC P1E38</u>	Auxiliary Transmission Fluid Pump Inverter Supply Voltage Circuit

DTC	Description
<u>DTC P1E39</u>	Auxiliary Transmission Fluid Pump Inverter Performance
<u>DTC P1E3A</u>	Auxiliary Transmission Fluid Pump Motor Torque Delivered Performance
<u>DTC P1E4A or P1E4B</u>	Control Module Redundant Drive Motor 1 Speed Sensing Circuit
<u>DTC P1F00</u>	Auxiliary Transmission Fluid Pump Inverter Temperature Sensor Circuit Erratic
<u>DTC P1F63, P1F65</u>	Hybrid/EV System Voltage Discharge Circuit
<u>DTC P2797</u>	Auxiliary Transmission Fluid Pump Performance
<u>DTC P3260</u>	Internal Control Module Drive Motor Control Performance

HYBRID / EV COOLING SYSTEM - DTCS

HYBRID / EV COOLING SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
<u>DTC P0480</u>	Cooling Fan Relay Control Circuit
<u>DTC P0A7E</u>	Hybrid/EV Battery Pack High Temperature
<u>DTC P0A9C, P0A9E, P0AC6-P0ACD, P0AE9-P0AEB, P0BC3-P0BC5, or P0C34-P0C36</u>	Hybrid/EV Battery Temperature Sensor
<u>DTC P0C43, P0C46</u>	Hybrid/EV Battery Pack Coolant Temperature Sensor
<u>DTC P0C47, P1E8C, or P1E8D</u>	Hybrid/EV Battery Pack Coolant Pump
<u>DTC P0CE9, P1F44, or P1F45</u>	Hybrid/EV Electronics Coolant Pump
<u>DTC P0CEE, P0CF2</u>	Hybrid/EV Electronics Coolant Temperature Sensor
<u>DTC P19FA, P19FC</u>	Hybrid/EV Electronics Coolant Pump Feedback
<u>DTC P19FD, P19FF</u>	Hybrid/EV Battery Pack Coolant Pump Feedback Circuit
<u>DTC P148A, P148C</u>	Cooling Fan Signal Circuit
<u>DTC P1EC6</u>	Hybrid/EV Battery Pack Heater Performance
<u>DTC P1FFB, P1FFE</u>	Hybrid/EV Battery Pack Coolant Level
<u>DTC P1FFF</u>	System Isolation/Coolant Level Sensor Fault - Hybrid/EV Battery Charging System Disabled

HYBRID / EV ENERGY STORAGE SYSTEM - DTCS

HYBRID / EV ENERGY STORAGE SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
<u>DTC P0A0C or P0A0D</u>	High Voltage System Interlock Circuit Voltage
<u>DTC P0A7F</u>	Hybrid/EV Battery Pack

DTC	Description
<u>DTC P0AA1, P0AA4, P0AD9, P0ADD, P0AE3, P0AE4, P0D09, P0D0A, P1EBD, P1EC0, or P1EC3</u>	Hybrid/EV Battery Positive Contactor/Hybrid/EV Battery Negative Contactor/Hybrid/EV Battery Precharge Contactor/Battery Charging System Positive Contactor/Battery Charging System Contactor(s) Stuck Open/Hybrid/EV Battery System Contactor(s) Stuck Open/Hybrid/EV Battery Pack Heater Transistor Control Circuit
<u>DTC P0AA6 or P1AE6</u>	Hybrid/EV Battery Voltage System Isolation Lost/Battery Energy Control Module Hybrid/EV Battery Voltage Isolation Sensor Circuit
<u>DTC P0ABB, P0ABC, or P0ABD</u>	Hybrid/EV Battery Voltage Sensor
<u>DTC P0AC1, P0AC2, P0B10, P0B11, P0B13, P1EBA, or P1EBB</u>	Hybrid/EV Battery Low Resolution Current Sensor/Hybrid/EV Battery High Resolution Current Sensor
<u>DTC P0AF8</u>	Hybrid System Voltage
<u>DTC P0AFA or P0AFB</u>	Hybrid/EV Battery System Voltage
<u>DTC P0B3B, P0BBB, P1B16-P1B2D, P1B45-P1BFE, P1E01-P1E06, or P1E4C-P1E8B</u>	Hybrid/EV Battery (1-96) Circuit(s)
<u>DTC P0C78 or P3061</u>	Hybrid/EV Battery System Precharge Time Too Long/Hybrid/EV Battery Precharge High Current
<u>DTC P1A07, P1E93, P1E99, P1E9F, P1EA5, P1FC3, P1FC8, P3035, or P3040</u>	Battery Energy Control Module 5 V Reference Circuit/Hybrid/EV Battery Interface Control Module (1-12) 5 V Reference Circuit(s)
<u>DTC P1E92, P1E98, P1E9E, P1EA4, P1FC9, P1FCA, P1FCE, P3036, or P3041</u>	Hybrid/EV Battery Interface Control Module (1-12) Cell Balancing Circuit(s)
<u>DTC P1EAB or P1EAC</u>	Battery Energy Control Module Hybrid/EV Battery Cell High Voltage/Hybrid/EV Battery Cell Overvoltage Signal Circuit Performance
<u>DTC P1FD5, P1FF2, P3038-P303A, or P3043-P3045</u>	Hybrid/EV Battery Interface Control Module (1-12) Voltage Sensor(s)
<u>DTC P1F17</u>	System Isolation / Impact Sensor Fault - Hybrid/EV Battery System Contactors Open

HYBRID PLUG-IN CHARGING - DTCS

HYBRID PLUG-IN CHARGING - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
<u>DTC P0CF4, P0CF6</u>	Control Pilot Circuit
<u>DTC P0CF9 or P0D01</u>	Control Pilot Charging Switch Performance
<u>DTC P0D1F</u>	Control Module Date/Time Synchronization Performance
<u>DTC P0D26</u>	Battery Charger System Precharge Time Too Long
<u>DTC P0D2B or P0D2C</u>	Control Pilot/Status Indicator Control Circuit
<u>DTC P0D3E, P0D40</u>	Battery Charger Input Voltage Sensor

DTC	Description
<u>DTC P0D4D, P0D4F</u>	Battery Charger Hybrid/EV Battery Output Voltage Sensor
<u>DTC P0D58 or P0D59</u>	Proximity Detection Circuit Low/High Voltage
<u>DTC P0D5A</u>	Proximity Detection Circuit Erratic
<u>DTC P0D5C</u>	Battery Charger Hybrid/EV Battery Output Power Performance
<u>DTC P0D5E</u>	Battery Charger System High Voltage Present
<u>DTC P0E61 or P0E65</u>	Battery Charger Enable Circuit
<u>DTC P1EE6</u>	Battery Charger AC Voltage Not Present

HYDRAULIC BRAKE SYSTEM - DTCS

HYDRAULIC BRAKE SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
<u>DTC C0075</u>	Brake Pedal Position Sensor Performance
<u>DTC C0579, C057A, or C057E</u>	Brake Booster Control Module Temperature Sensor
<u>DTC C057E, C0582, C058A, C0590, C0591, C0595, C0596, or C1275, C1277</u>	Brake Booster Motor
<u>DTC C0580 or C0594</u>	Brake Booster Motor
<u>DTC C1072</u>	Brake Fluid Level Sensor Circuit
<u>DTC C111C</u>	Low Brake Fluid Indicated
<u>DTC C1278 or C1279</u>	Brake System Data 2 Message Counter Incorrect
<u>DTC C1449</u>	System Configuration Error
<u>DTC P057B, P057E, P05DC-P05DE, or P05E0</u>	Brake Pedal Position Sensor
<u>DTC P0601, P0603, P0604, P0606, P060B, or P062F</u>	Control Module
<u>DTC P0642, P06A6, or P06A7</u>	Sensor Reference Voltage
<u>DTC P25C6 or P25C7</u>	Brake Booster Temperature Sensor

IMMOBILIZER SYSTEM - DTCS

IMMOBILIZER SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
<u>DTC B2955</u>	Security Sensor Data Circuit Malfunction
<u>DTC B302A</u>	Mobile Telephone Communications Interface Requested Immobilization
<u>DTC B3031</u>	Security Controller In Learn Mode
<u>DTC B3055</u>	No Transponder Modulation or No Transponder
<u>DTC B305C</u>	Immobilizer Transponder of Wrong Type Programmed
<u>DTC B3060</u>	Unprogrammed Transponder Identification Code Received
<u>DTC B3899</u>	Incorrect Immobilizer Identifier Received

DTC	Description
<u>DTC B389A</u>	Environment Identification
<u>DTC B3902</u>	Incorrect Immobilizer Identifier Received
<u>DTC B3924, B3928</u>	Incorrect Environmental Identifier Received
<u>DTC B3935</u>	Transponder Authentication
<u>DTC B3976</u>	Unconfigured Transponder
<u>DTC B3978, B3982</u>	Incorrect Environmental Identifier Received
<u>DTC B3984</u>	Device 1 Environment Identifier Not Programmable
<u>DTC P0513</u>	Immobilizer Key Incorrect
<u>DTC P0633</u>	Immobilizer Key Not Programmed
<u>DTC P162B</u>	Remote Vehicle Speed Limiting Signal Message Counter Incorrect
<u>DTC P1631</u>	Immobilizer Fuel Enable Signal Not Correct
<u>DTC P1649</u>	Immobilizer Security Code Not Programmed

INSTRUMENT PANEL SYSTEM DISPLAYS AND GAUGES - DTCS

INSTRUMENT PANEL SYSTEM DISPLAYS AND GAUGES - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
<u>DTC B0158</u>	Ambient Air Temperature Sensor
<u>DTC B0550</u>	Odometer Circuit General Memory Malfunction
<u>DTC B071F</u>	Transmission Range Indicator Internal Malfunction
<u>DTC B124F</u>	MOST Programming Failure
<u>DTC P0071, P0074</u>	Ambient Air Temperature Sensor
<u>DTC P0461, P0464</u>	Fuel Level Sensor
<u>DTC P0521, P0522, or P0523</u>	Engine Oil Pressure Sensor

KEYLESS ENTRY SYSTEM AND REMOTE FUNCTIONS - DTCS

KEYLESS ENTRY SYSTEM AND REMOTE FUNCTIONS - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
<u>DTC B305D</u>	Challenge Active Circuit
<u>DTC B3101</u>	Keyless Entry Data Link Circuit
<u>DTC B3105</u>	Keyless Entry Transmitters
<u>DTC B3106</u>	Keyless Entry Data Link
<u>DTC B3109, B3113</u>	Keyless Entry Transmitter (1-5) Battery
<u>DTC B310D, B310F</u>	Keyless Entry Transmitter (6-8) Battery
<u>DTC B3119</u>	Keyless Entry Antenna 1
<u>DTC B3120</u>	Keyless Entry Antenna 2
<u>DTC B3121</u>	Keyless Entry Antenna 3
<u>DTC B3122</u>	Keyless Entry Antenna 4

DTC	Description
<u>DTC B3123</u>	Keyless Entry Antenna 5
<u>DTC B3124</u>	Keyless Entry Antenna 6

LIGHTING SYSTEM - DTCS

LIGHTING SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
<u>DTC B1395</u>	Control Module Voltage Reference Output Circuit Voltage
<u>DTC B1480</u>	Battery Rundown Protection Circuit Short to Ground
<u>DTC B2545</u>	Backup Lamps Circuit
<u>DTC B255D</u>	Passenger Compartment Lamp Control 2 Circuit
<u>DTC B2570</u>	Trunk Lamp Control Circuit Short to Ground
<u>DTC B2575 or B2699</u>	Left Headlamp Control Circuit/Right Headlamp Control Circuit
<u>DTC B257A</u>	Headlamp Switch Input Signals Correlation Malfunction
<u>DTC B2580</u>	Headlamp High Beam Control Circuit
<u>DTC B2585 or B3867</u>	Left Park Lamps Control Circuit/Right Park Lamps Control Circuit
<u>DTC B2600 or B2605</u>	Left Daytime Running Lamps Control Circuit Short to Ground/Right Daytime Running Lamps Control Circuit Short to Ground
<u>DTC B2610</u>	Passenger Compartment Dimming 1 Circuit
<u>DTC B2615</u>	Passenger Compartment Dimming 2 Circuit Short to Ground
<u>DTC B2625</u>	Display Dimming Pulse Width Modulation Output Circuit Short to Ground
<u>DTC B3596</u>	Hazard Lamps Request Circuit Malfunction
<u>DTC B3600</u>	Passenger Compartment Dimming Request Signal Circuit Voltage
<u>DTC B3650</u>	High Beam Request Signal Circuit Performance - Signal Invalid
<u>DTC B3806</u>	High Beam and Headlamp Flash Select Circuit Malfunction
<u>DTC B3881 or B3882</u>	Left Tail Lamp Circuit/Right Tail Lamp Circuit
<u>DTC B3883</u>	License Plate Lamp Circuit
<u>DTC B3884</u>	Center High Mounted Stop Lamp Circuit
<u>DTC B3948 or B3949</u>	Left Front Turn Signal Circuit/Right Front Turn Signal Circuit
<u>DTC B3950 or B3951</u>	Left Rear Turn Signal Circuit/Right Rear Turn Signal Circuit

DTC	Description
<u>DTC C0277 or C0890</u>	Brake Pedal Position Sensor Circuit/Control Module Voltage Reference Output 3 Circuit Voltage
<u>DTC C0297</u>	Brake Applied Output Circuit Short to Ground

OBJECT DETECTION SYSTEM - PARK ASSIST SYSTEM - DTCS

OBJECT DETECTION SYSTEM - PARK ASSIST SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
<u>DTC B094B or B094C</u>	Left Side Object Detection Control Module/Right Side Object Detection Control Module
<u>DTC B0954, B0955, B0956, or B0957</u>	Parking Assist Front Sensor Circuits
<u>DTC B0958, B0959, B0960, or B0961</u>	Parking Assist Rear Sensor Circuits
<u>DTC B096B</u>	Parking Assist Switch Parallel Parking Circuit
<u>DTC B096C or B096D</u>	Parking Assist Side Sensor Left Front Circuit/Parking Assist Side Sensor Right Front Circuit
<u>DTC B0987</u>	Vehicle Direction Camera Indicator Circuit
<u>DTC B1011</u>	System Disabled Information Stored
<u>DTC B1015</u>	Vehicle Identification Number Information
<u>DTC B101D (DTC set in K109 Frontview Camera Module)</u>	Electronic Control Unit Hardware
<u>DTC B127B</u>	Rearview Camera Input Signal Circuit Missing Reference
<u>DTC B1405</u>	Control Module Voltage Reference Output 2 Circuit
<u>DTC B356A</u>	Vehicle Direction Warning Switch Circuit Short to Ground
<u>DTC B390C</u>	Long Range Radar Sensor Module
<u>DTC B390D</u>	Frontview Camera Module Incorrect Mounting
<u>DTC P15F6</u>	Front Object Detection Control Module Torque Request Signal Message Counter Incorrect

PARKING BRAKE SYSTEM - DTCS

PARKING BRAKE SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
<u>DTC C1138</u>	Supply Voltage Goes Below 7 V/Above 16.5 V/Signal Performance
<u>DTC C1148</u>	Left Park Brake Actuator Circuit
<u>DTC C114C</u>	Park Brake Switch Circuit
<u>DTC C1586</u>	Right Park Brake Actuator Circuit
<u>DTC C1587</u>	Left Park Brake Actuator
<u>DTC C1588</u>	Right Park Brake Actuator

POWER DOOR LOCK SYSTEM AND RELEASE SYSTEMS - DTCS

POWER DOOR LOCK SYSTEM AND RELEASE SYSTEMS - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
<u>DTC B1474 or B3849</u>	Passenger Exterior Door Handle Switch Circuit Short to Ground/Driver Exterior Door Handle Switch Circuit Short to Ground
<u>DTC B1534 or B1535</u>	Left Rear Door Handle Switch Circuit Short to Ground/Right Rear Door Handle Switch Circuit Short to Ground
<u>DTC B297B or B297C</u>	Driver Door Open Switch Circuit Not Plausible
<u>DTC B3125, B3130, or B3135</u>	Driver Door Only Unlock Circuit/All Doors Unlock Circuit/All Doors Lock Circuit
<u>DTC B3140, B3145, B3150, or B3155</u>	Door Unlock Switch Circuits
<u>DTC B3265</u>	Trunk Lid Unlatch Output Circuit Short to Ground
<u>DTC B3618</u>	Exterior Liftgate Unlatch Switch Circuit Malfunction
<u>DTC P0CCC, P0CCE, or P0CCF</u>	Charge Port Door Position Sensor Circuit
<u>DTC P04B6</u>	Fuel Fill Door Stuck Closed
<u>DTC P04B8, P04BA</u>	Fuel Fill Door Position Sensor Circuit
<u>DTC P04BB, P04BC, or P04C0</u>	Fuel Fill Door Lock Control Circuit
<u>DTC P04C8, P04CA, or P04CB</u>	Fuel Fill Door Open Request Switch Circuit
<u>DTC P169D</u>	Fuel Fill Door Open Request Switch Wake-Up Circuit Performance

POWER STEERING SYSTEM - DTCS

POWER STEERING SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
<u>DTC C0176</u>	Control Module Temperature Sensor High Temperature
<u>DTC C0460</u>	Steering Wheel Angle Sensor
<u>DTC C0475</u>	Power Steering Motor Circuit Malfunction
<u>DTC C0545</u>	Steering Wheel Torque Sensor
<u>DTC C055C</u>	Steering Gear Performance Malfunction
<u>DTC C0569</u>	Internal Check Sum Error/Calibration Not Programmed/Configuration Not Programmed
<u>DTC C056D</u>	Electronic Control Unit Hardware (Power Steering Control Module)
<u>DTC C056E</u>	Electronic Control Unit Software
<u>DTC C1436</u>	Steering Wheel Angle Signal

SEAT BELT SYSTEM - DTCS

SEAT BELT SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
<u>DTC B0072 or B0073</u>	Driver/Passenger Seat Belt Switch
<u>DTC B059A</u>	Passenger Seat Belt Indicator Circuit

SEAT HEATING SYSTEM AND SEAT COOLING SYSTEM - DTCS

SEAT HEATING SYSTEM AND SEAT COOLING SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
<u>DTC B191A or B191B</u>	Front/Rear Heated Seat Module

SECONDARY AND CONFIGURABLE CUSTOMER CONTROL SYSTEM - DTCS

SECONDARY AND CONFIGURABLE CUSTOMER CONTROL SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
<u>DTC B3622</u>	Steering Wheel Controls Signal Circuit

SHIFT LOCK CONTROL SYSTEM - DTCS

SHIFT LOCK CONTROL SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
<u>DTC B270A</u>	Park Lock Solenoid Control Circuit Short to Battery/Ground

SUPPLEMENTAL INFLATABLE RESTRAINT SYSTEM - DTCS

SUPPLEMENTAL INFLATABLE RESTRAINT SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
<u>DTC B0012 or B0013</u>	Driver Steering Wheel Air Bag Deployment Loop Stage 1/Driver Steering Wheel Air Bag Deployment Loop Stage 2
<u>DTC B0014, B0021, B0031, or B0038</u>	Seat Side Air Bag Deployment Loops
<u>DTC B0015, B001A, B001B, or B0022</u>	Seat Belt Retractor Pretensioner Deployment Loops/Seat Belt Anchor Pretensioner Deployment Loops
<u>DTC B0016, B0018, B0023, or B0025</u>	Left Roof Rail Air Bag Deployment Loop/Right Roof Rail Air Bag Deployment Loop
<u>DTC B0017 or B0024</u>	Driver Knee Air Bag Deployment Loop/Passenger Knee Air Bag Deployment Loop
<u>DTC B0019 or B0020</u>	Passenger Instrument Panel Air Bag Deployment Loop Stage 1/Passenger Instrument Panel Air Bag

DTC	Description
	Deployment Loop Stage 2
<u>DTC B0052</u>	Deployment Commanded
<u>DTC B0074</u>	Passenger Presence Sensor
<u>DTC B0081</u>	Passenger Presence Module
<u>DTC B0083 or B0084</u>	Left Front Impact Sensor/Right Front Impact Sensor
<u>DTC B0085 or B0088</u>	Left Front Side Impact Sensor/Right Rear Side Impact Sensor
<u>DTC B0086 or B0087</u>	Right Front Side Impact Sensor/Left Rear Side Impact Sensor
<u>DTC B067F or B0680</u>	Passenger Air Bag On Indicator Circuit/Passenger Air Bag Off Indicator Circuit
<u>DTC B1001</u>	Option Configuration (Inflatable Restraint Sensing and Diagnostic Module)
<u>DTC B1001</u>	Option Configuration Error (Passenger Presence System)
<u>DTC B1019</u>	System Configuration Error

THEFT DETERRENT SYSTEM - DTCS

THEFT DETERRENT SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
<u>DTC B291A</u>	Content Theft Deterrent Assembly Internal Malfunction
<u>DTC B291B</u>	Content Theft Deterrent Sensor

TIRE PRESSURE MONITORING SYSTEM - DTCS

TIRE PRESSURE MONITORING SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
<u>DTC C0569</u>	System Configuration Malfunction
<u>DTC C0750, C0755, C0760, or C0765</u>	Front Tire Pressure Sensor
<u>DTC C0775</u>	Tire Pressure Monitoring System Sensors Malfunction

WIPER SYSTEM AND WASHER SYSTEM - DTCS

WIPER SYSTEM AND WASHER SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
<u>DTC B3715</u>	Windshield Wiper Relay Circuit
<u>DTC B371A</u>	Windshield Wiper Motor Internal Malfunction
<u>DTC B371C</u>	Front Wiper Motor 2

DTC	Description
<u>DTC B3873</u>	Front Washer Relay Circuit

WIRING SYSTEMS AND POWER MANAGEMENT - DTCS

WIRING SYSTEMS AND POWER MANAGEMENT - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
<u>DTC B097B</u>	Power Mode Start Switch Circuit (1 Of 2)
<u>DTC B097B</u>	Power Mode Start Switch Circuit (2 Of 2)
<u>DTC B097C</u>	Power Mode Run/Crank Indicator Circuit Short to Ground
<u>DTC B1370</u>	Control Module Ignition On and Start Circuit (Instrument Cluster)
<u>DTC B144A</u>	Run Power Relay Circuit
<u>DTC B144B</u>	Run/Crank Power Relay Circuit
<u>DTC B1451</u>	Accessory Power Circuit
<u>DTC B305E</u>	Interruptible RAP Relay Circuit
<u>DTC P15B9 or P15BA</u>	Electric A/C Compressor Control Module Ignition On/Start Switch Circuit Voltage
<u>DTC P1A5E or P1A5F</u>	Battery Energy Control Module Ignition On/Start Switch Circuit Low Voltage
<u>DTC P1A60</u>	Battery Energy Control Module Ignition Accessory Switch Circuit Low Voltage
<u>DTC P2534 or P2535</u>	Ignition On/Start Switch Circuit Voltage
<u>DTC P2537</u>	Ignition Accessory Switch Circuit Low Voltage

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC P0335 OR P0336: CRANKSHAFT POSITION SENSOR

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P0335

Crankshaft Position Sensor Circuit

DTC P0336

Crankshaft Position Sensor Performance

Circuit/System Description

The crankshaft position sensor circuits consist of an engine control module (ECM) supplied 5 V reference circuit, low reference circuit, and an output signal circuit. The crankshaft position sensor is a magnetic biased digital output integrated circuit sensing device. The sensor detects magnetic flux changes of invisible magnetic segments on the edge of the crankshaft position reluctor ring mounted on the crankshaft. Each magnetic segment on the ring is spaced at a 60 segment spacing with 2 missing spaces for a reference gap. The crankshaft position sensor produces an ON/OFF DC voltage of varying frequency, with 58 output pulses per crankshaft revolution. The frequency of the crankshaft position sensor output depends on the velocity of the crankshaft. The crankshaft position sensor sends a digital signal, which represents an image of the crankshaft reluctor ring, to the ECM as each segment on the ring rotates past the crankshaft position sensor. The ECM uses each crankshaft position signal pulse to determine crankshaft speed and decodes the crankshaft reluctor ring reference gap to identify crankshaft position. This information is then used to determine the optimum ignition and injection points of the engine. The ECM also uses crankshaft position sensor output information to determine the camshaft relative position to the crankshaft, to control camshaft phasing, and to detect cylinder misfire.

The ECM also generates and sends a replicated signal over a dedicated line to the hybrid/EV powertrain control module 1.

The hybrid/EV powertrain control module 1 uses crankshaft speed and position to confirm internal combustion engine (ICE) status in various modes; for example to confirm Autostart and Autostop functionality. In addition to the signal sent over the dedicated line, this information is also sent from the ECM to the hybrid/EV powertrain control module 1 over serial data. The serial data status will be used by the hybrid/EV powertrain control module 1 in the event of a failure of this circuit.

Conditions for Running the DTC

P0335 or P0336

The vehicle is ON.

Conditions for Setting the DTC

P0335

No signal from the crank sensor for more than 1.4 seconds.

P0336

The signal from the crank sensor is invalid for more than 1.4 seconds.

OR

15 crankshaft sensor resync events occur in less than 10 seconds.

Action Taken When the DTC Sets

DTCs P0335 and P0336 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0335 and P0336 are Type B DTCs.

Diagnostic Aids

A high resistance ground for either the power inverter module, often referred to as the drive motor generator power inverter module, or the ECM may cause these DTCs to set intermittently. Inspect all grounds for good, secure connections.

Scan Tool Reference

Control Module References for scan tool information

Special Tools

- **EL-35616** Terminal Test Kit
- **EL-38522** Variable Signal Generator

Equivalent regional tools: Special Tools

Circuit/System Verification

1. Engine Running, observe the hybrid/EV powertrain control module Engine Speed parameter with a scan tool.
2. Verify the Engine Speed parameter displays the current engine speed, matching the tachometer and/or the ECM Engine Speed parameter.
 - **If the hybrid/EV powertrain control module Engine Speed parameter displays a value other than the current engine speed**

Refer to Circuit/System Testing.
 - **If the Engine Speed parameter displays a value matching the current engine speed**
3. All OK

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down.
2. Disconnect the X2 harness connector at the K20 ECM.
3. Using the **EL 35616** terminal test kit, connect the **EL 38522** variable signal generator red lead to the Crankshaft 60X Sensor Signal circuit terminal 42 at the harness. Connect the **EL 38522** variable signal generator black lead to ground.
4. Set the **EL 38522** variable signal generator SIGNAL to 12 V, FREQUENCY to 30 Hz, and DUTY CYCLE to NORMAL, 50 percent. Plug power cord in to vehicle being tested or another power source.
5. Vehicle ON.

NOTE: **With the variable signal generator set at 30 Hz, the Crankshaft Position Resync Counter should cycle from 0 - 255 in 8.5 seconds.**

6. Verify with a scan tool the hybrid/EV powertrain control module Crankshaft Position Resync Counter parameter displays a constantly changing value.
 - **If parameter does not display a constantly changing value**
 1. Vehicle OFF, disconnect **EL 38522** variable signal generator red and black leads, disconnect the X1 harness connector at the T6 power inverter module, vehicle ON.
 2. Test for less than 1 V between the signal circuit terminal 29 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Vehicle OFF.
 4. Test for infinite resistance between the signal circuit terminal 29 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance
5. Test for less than 2 Ω in the signal circuit end to end.
- If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the T6 power inverter module.
 - **If parameter displays a constantly changing value**

7. Replace the K20 ECM.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: [Diagnostic Repair Verification](#)

Refer to [Control Module References](#) for engine control module or T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup

DTC P0506 OR P0507: IDLE SPEED LOW/HIGH

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC P0506

Idle Speed Low

DTC P0507

Idle Speed High

Circuit/System Description

The hybrid/EV powertrain control module 1 determines the engine idling speed which varies based on the hybrid/EV battery pack state of charge. The engine control module (ECM) achieves throttle positioning by providing a pulse width modulated voltage to the throttle actuator motor. The throttle blade is spring loaded in both directions, and the default position is slightly open. The hybrid/EV powertrain control module 1 can detect a condition where the engine is cranking but does not start or has stalled, or if the engine speed does not match the commanded speed.

The throttle actuator control (TAC) motor is controlled by the ECM. The DC motor located in the throttle body drives the throttle blade. In order to decrease engine speed, along with spark and fuel delivery changes the ECM commands the throttle closed reducing air flow into the engine and the engine speed decreases. In order to increase engine speed, the ECM commands the throttle plate open allowing more air to pass the throttle plate. If the hybrid/EV powertrain control module 1 detects the actual engine speed is not within a predetermined range of the commanded engine speed, this DTC sets.

Conditions for Running the DTC

P0506

- DTCs P0722, P077B, P0A3F, P0A40, P0A45, P0A46, P0C52, P0C53, P0C57, P0C58, P0C5C, P0C5D, P0C61, P0C62, P1B03, P1B04, P215C are not set.
- The system voltage is greater than 9 volts.

- The accelerator pedal position is valid.
- The accelerator pedal position is less than 1 percent.
- The engine has been running for greater than 60 seconds.
- The vehicle speed is less than 2 km/h (1.2 mph).
- The engine coolant temperature (ECT) is 60Â°C (140Â°F) or greater.
- The commanded engine speed is steady within 50 RPM.

P0507

- The commanded engine speed is steady within 25 RPM.
- A scan tool output control is not active.
- DTCs P0506 or P0507 run continuously when the above conditions are met for greater than 10 seconds.

Conditions for Setting the DTC

P0506

The actual engine speed is at least 91 RPM less than the commanded engine speed.

P0507

The actual engine speed is at least 182 RPM greater than the commanded engine speed.

Action Taken When the DTC Sets

DTCs P0506 and P0507 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0506 and P0507 are Type B DTCs.

Diagnostic Aids

- A stalling condition can cause DTC P0506 to set.
- An intermittent vehicle speed sensor (VSS) signal can cause DTC P0507 to set.

Circuit/System Verification

1. Verify no other DTCs are set.

- **If any other DTCs are set**

Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

- **If no other DTCs are set**

2. Verify none of the conditions listed below exist:

P0506

- Excess deposits in the Q38 Throttle Body. Refer to Throttle Body Inspection and Cleaning .
- Restricted exhaust
- Mechanical conditions that limit engine speed
- Parasitic load on the engine - For example, a transmission condition, a belt driven accessory condition.
- **If a condition exists**

Repair as necessary.

- **If no condition exists**

3. All OK

P0507

- Vacuum leaks
- A throttle valve that does not close correctly
- Verify the correct operation of the crankcase ventilation system. Inspect for the following conditions:
 - The routing of the positive crankcase ventilation (PCV) system
 - Vacuum leaks in the PCV system
- **If a condition exists**

Repair as necessary.

- **If no condition exists**

4. All OK

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

DTC P0601-P0604, P0606, P062F, P1EB6, OR P1EB7: CONTROL MODULE (HYBRID/EV POWERTRAIN CONTROL MODULE 1)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.

- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Control Module Processor Performance

DTC P062F

Control Module Long Term Memory Performance

DTC P1EB6

Drive Motor 1 Control Module Long Term Memory Reset

DTC P1EB7

Drive Motor 2 Control Module Long Term Memory Reset

Circuit/System Description

This is an internal fault detection of the hybrid/EV powertrain control module 1 or drive motor control modules. The hybrid/EV powertrain control module 1 and both drive motor control modules are internal to the power inverter module, often referred to as the drive motor generator power inverter module, and not serviced separately. This fault is handled inside the power inverter module, and no external circuits are involved.

Conditions for Running the DTC

- The vehicle is ON.
- The system voltage is greater than 9.5 V.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

Action Taken When the DTC Sets

- DTCs P0601 - P0604, P0606, P061A, P061B, P1EB6, and P1EB7 are Type A DTCs.
- DTC P062F is a Type B DTC.

- The hybrid/EV powertrain control module 1 requests the hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

- DTCs P0601 - P0604, P0606, P061A, P061B, P1EB6, and P1EB7 are Type A DTCs.
- DTC P062F is a Type B DTC.

DTC P061A OR P061B: CONTROL MODULE TORQUE SYSTEM

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC P061A

Control Module Torque System Circuitry Performance

DTC P061B

Control Module Torque Calculation Performance

Circuit/System Description

The hybrid/EV powertrain control module 1 is responsible for vehicle torque management. To accomplish this, the hybrid/EV powertrain control module 1 constantly monitors all aspects of requested and actual delivered torque from involved controllers. If a torque management fault is detected, propulsion power will be reduced or shut down. The hybrid/EV powertrain control module 1 is internal to the power inverter module, often referred to as the drive motor generator power inverter module, and is not serviced separately. This fault is handled inside the power inverter module and no external circuits are involved.

Conditions for Running the DTC

- The vehicle is ON.
- The system voltage is at least 9.5 V.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

Action Taken When the DTC Sets

- DTCs P061A or P061B are Type A DTCs.
- The hybrid/EV powertrain control module 1 requests the hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTCs P061A and P061B are Type A DTCs.

DTC P06AF: TORQUE MANAGEMENT SYSTEM PERFORMANCE - FORCED ENGINE SHUTDOWN

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P06AF

Torque Management System Performance - Forced Engine Shutdown

Circuit/System Description

The hybrid/EV powertrain control module 1 monitors a state of health message that the ECM transmits to verify the ECM is functioning properly. The hybrid/EV powertrain control module 1 is part of the power inverter module, often referred to as the drive motor generator power inverter module, and is not serviced separately.

Conditions for Running the DTC

The system voltage is greater than 9.5 V.

Conditions for Setting the DTC

The hybrid/EV powertrain control module 1 does not detect a valid state of health message from the ECM.

Action Taken When the DTC Sets

- DTC P06AF is a Type A DTC.
- The hybrid/EV powertrain control module 1 requests the hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTC P06AF is a Type A DTC.

- **If the DTC is not set**
3. Verify DTC P06AF is not set.
 - **If the DTC is set**
 1. Verify the T6 Power Inverter Module has the latest calibration in Calibration Information.
 - If the T6 Power Inverter Module does not have the latest calibration, program the T6 power inverter module.

- If the T6 Power Inverter Module has the latest calibration, replace the T6 Power Inverter Module.
2. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
 3. Verify the DTC does not set.
 - If the DTC sets, continue to Circuit/System Testing.
 - If the DTC does not set.

4. All OK.

- **If the DTC is not set**

4. All OK.

Circuit/System Testing

NOTE: Perform Circuit/System Verification before Circuit/System Testing.

1. Vehicle OFF.
2. Disconnect the X1 harness connector at the T6 Power Inverter Module and disconnect the X1 harness at the K20 ECM.
3. Test for less than 2 Ω on the serial data circuits listed below end to end.
 - T6 Power Inverter Module X1 connector terminal 33 to K20 ECM X1 connector terminal 8
 - T6 Power Inverter Module X1 connector terminal 34 to K20 ECM X1 connector terminal 7
 - **If 2 Ω or greater**

Repair the open/high resistance in the circuit.

 - **If less than 2 Ω**
4. Replace the K20 ECM.
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
6. Verify the DTC does not set.
 - **If the DTC sets**

Replace the T6 Power Inverter Module.

 - **If the DTC does not set**
7. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P06B1

Sensor Supply Voltage Circuit 1 Low Voltage

DTC P06B2

Sensor Supply Voltage Circuit 1 High Voltage

DTC P06B4

Sensor Supply Voltage Circuit 2 Low Voltage

DTC P06B5

Sensor Supply Voltage Circuit 2 High Voltage

DTC P06E7

Sensor Supply Voltage Circuit 3 Low Voltage

DTC P06E8

Sensor Supply Voltage Circuit 3 High Voltage

Circuit/System Description

The Hybrid/EV powertrain control module 1 and motor control modules share an internal 15 V reference power supply in order to operate the drive motor sensors processors. This fault is handled inside the power inverter module, often referred to as the drive motor generator power inverter module, and no external circuits are involved. The control modules listed below are part of the power inverter module and are not serviced separately:

- Drive motor 1 control module
- Drive motor 2 control module
- Hybrid/EV powertrain control module 1

Conditions for Running the DTC

- The vehicle is ON.
- The system voltage is 8 - 18 V.

Conditions for Setting the DTC

P06B1, P06B4, or P06E7

The reference voltage is less than 12 V for 1 s.

P06B2, P06B5, or P06E8

The reference voltage is greater than 22 V for 1 s.

Actions Taken When the DTC Sets

- DTCs P06B1, P06B2, P06B4, P06B5, P06E7, and P06E8 are Type A DTCs.
- The power inverter module requests the hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Actions Taken When the DTC Sets

DTCs P06B1, P06B2, P06B4, P06B5, P06E7, and P06E8 are Type A DTCs.

Diagnostic Aids

This DTC may set due to low 12 V system voltage.

Circuit/System Description

The drive motor position sensor is monitored by the motor control module. The motor control module monitors the angular position, speed and direction of the drive motor rotor based upon the signals of the resolver-type position sensor. The position sensor contains a drive coil, two driven coils, and an irregular shaped metallic rotor. The metallic rotor is mechanically attached to the shaft of the drive motor. At vehicle ON, the motor control module outputs a 7 V AC, 10 kHz excitation signal to the drive coil. The drive coil excitation signal creates a magnetic field surrounding the two driven coils and the irregular shaped rotor. The motor control module then monitors the two driven coil circuits for return signals, often referred to as Sine and Cosine waveforms, abbreviated SIN and COS. The position of the irregular metallic rotor causes the magnetically-induced return signals of the driven coils to vary in size and shape. A comparison of the two driven coil signals allows the motor control module to determine the exact position, speed and direction of the drive motor rotor. The drive motor 1 position sensor is serviceable separately from the drive motor assembly.

Conditions for Running the DTC

The vehicle is ON.

Conditions for Setting the DTC

P0C52, P0C5C

Circuit voltage is less than 0.5 V.

P0C53, P0C5D

Circuit voltage is greater than 4.5 V.

P0A3F

SIN or COS signal is less than 2.3 V. The motor control module cannot determine the motor position based upon the sensor signals.

P0A40

SIN or COS signal is greater than 4 V. The motor control module detects a degraded motor position sensor signal.

P1B03

The motor control module is unable to track the motor position based upon the sensor signals.

Action Taken When the DTC Sets

P0A3F, P0A40, P1B03

- DTCs P0A3F, P0A40, and P1B03 are Type A DTCs.
- Vehicle propulsion will be disabled.

P0C52, P0C53, P0C5C, P0C5D

DTCs P0C52, P0C53, P0C5C, and P0C5D are Type B DTCs.

Conditions for Clearing the DTC

- DTCs P0A3F, P0A40, and P1B03 are Type A DTCs.
- DTCs P0C52, P0C53, P0C5C, and P0C5D are Type B DTCs.

Diagnostic Aids

The drive motor position sensor circuits operate at very low current. These circuits are susceptible to moisture intrusion, corrosion, and terminal damage. Extreme care must be taken when probing terminals and manipulating harnesses. Poor terminal connections can result in intermittent operation.

In the case of intermittent concerns, clearing DTC information and returning the vehicle to the customer without a repair is not appropriate. Contact technical assistance when the cause of an intermittent concern cannot be identified.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury

or death.

NOTE: If the position sensor or wiring harness circuits fail the circuit tests, replace the component; do not repair.

1. Disable High Voltage, refer to [High Voltage Disabling](#) .
2. Remove the Drive Motor Power Inverter Module Cover, refer to [Drive Motor Power Inverter Module Cover Replacement](#) .
3. Vehicle OFF, disconnect the X4 harness connector at the T6 Power Inverter Module.
4. Test for greater than 10,000 Ω between the terminals listed below and ground:
 - Excitation Reference circuit terminal 9 X4
 - Excitation Reference circuit terminal 10 X4
 - SIN Signal circuit terminal 5 X4
 - SIN Signal circuit terminal 6 X4
 - COS Signal circuit terminal 7 X4
 - COS Signal circuit terminal 8 X4
 - **If less than 10,000 Ω**
 1. Remove the transmission, refer to [Transmission Replacement](#) .
 2. Disconnect the connector at the B228B Drive Motor 1 Position Sensor, refer to [Drive Motor Removal - 1st Position](#) .
 3. Test for less than 10,000 Ω between the appropriate harness terminal and ground.
 - If less than 10,000 Ω , replace the transmission wiring harness assembly.
 - If greater than 10,000 Ω , replace the B228B Drive Motor 1 Position Sensor.
 - **If greater than 10,000 Ω**
5. Test for 4.0 - 25 Ω between the terminals listed below:
 - Excitation Reference circuit terminal 10 and Reference circuit terminal 9
 - COS Signal circuit 1 terminal 7 and Signal circuit 1 terminal 8
 - SIN Signal circuit 2 terminal 5 and Signal circuit 2 terminal 6
 - **If not within the specified range**
 1. Disconnect the connector at the B228B Drive Motor 1 Position Sensor.
 2. Test for 4.0 - 25 Ω between the connector terminals listed below:
 - Excitation Reference circuit terminal 3 and Excitation Reference circuit terminal 4
 - COS Signal circuit terminal 1 and COS Signal circuit terminal 2
 - SIN Signal circuit terminal 5 and SIN Signal circuit terminal 6
 - If within the specified range, replace the transmission wiring harness assembly.
 - If not within the specified range, replace the B228B Drive Motor 1 Position Sensor.
 - **If within the specified range**
6. Replace the T6 Power Inverter Module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Drive Motor Power Inverter Module Cover Replacement](#)
- Refer to [Drive Motor Disassemble - 1st Position](#) for B228A Drive Motor 1 Position Sensor replacement

- Refer to [Automatic Transmission Wiring Harness Replacement](#)
- Refer to [Control Module References](#) for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming and setup

DTC P0A6A

Drive Motor 2 Phase V Low Current

DTC P0A6D

Drive Motor 2 Phase W Low Current

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains the motor control modules and the hybrid/EV powertrain control module 1. Each motor control module operates its respective drive motor based upon hybrid/EV powertrain control module 1 commands. Each motor control module controls the speed, direction and output torque of its respective drive motor through the sequencing actuation of high current switching transistors called insulated gate bipolar transistors. Each drive motor operates utilizing 3-phase alternating current (AC) electricity. Each insulated gate bipolar transistor operates a single phase of the drive motor. Each phase is individually identified as U, V and W. Each motor control module monitors the current of each phase in order to detect power inverter module fault conditions.

Conditions for Running the DTC

The vehicle is ON.

Conditions for Setting the DTC

One or more phase currents are less than 1.0 A.

Action Taken When the DTC Sets

DTCs P0A5E, P0A61, P0A64, P0A67, P0A6A, and P0A6D are Type A DTCs.

Conditions for Clearing the DTC

DTCs P0A5E, P0A61, P0A64, P0A67, P0A6A, and P0A6D are Type A DTCs.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P0A5E, P0A61, P0A64, P0A67, P0A6A, and P0A6D is not set.
 - **If any of the DTCs are set**
 1. Clear the DTC, vehicle OFF for 2 minutes to allow all control modules to shut down.
 2. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
 3. Verify the DTC does not set.
 - If the DTC sets, continue to Circuit/System Testing.
 - If the DTC does not set
 - **If none of the DTCs are set**
3. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

NOTE: Perform Circuit/System Verification before Circuit/System Testing.

1. Perform the **High Voltage Disabling** procedure for servicing the T6 Power Inverter Module or T12 Transmission.
2. Remove the T6 Power Inverter Module. Refer to **Drive Motor Generator Power Inverter Module Replacement**.
3. Test for infinite resistance between each of the AC circuit terminals listed below and ground for each phase of the appropriate M15 Drive Motor:

Drive Motor 1

- Terminal 3 phase U
- Terminal 2 phase V
- Terminal 1 phase W

Drive Motor 2

- Terminal 3 phase U
- Terminal 2 phase V
- Terminal 1 phase W
- **If less than infinite resistance**

Replace the M15 Drive Motor.

- **If infinite resistance for all AC circuits**

4. Test for less than 1 Ω between the AC circuit terminals listed below:

- Terminal 3 phase U to terminal 2 phase V
- Terminal 3 phase U to terminal 1 phase W
- Terminal 2 phase V to terminal 1 phase W
- **If 1 Ω or greater**

Replace the M15 Drive Motor.

- **If less than 1 Ω**

5. Verify the DTC does not set.

- **If the DTC sets**

1. Perform each of the operations listed below one at a time until the fault is corrected.

- Replace the T6 Power Inverter Module.
- Replace the M15 Drive Motor.

2. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

3. Repeat the DTC check.

- **If the DTC does not set**

6. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to [Drive Motor Removal - 1st Position](#) for Drive Motor 1 replacement
- Refer to [Drive Motor Removal - 2nd Position](#) for Drive Motor 2 replacement
- Refer to [Control Module References](#) for Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup

DTC P0A78 OR P0A79: DRIVE MOTOR 1-2 INVERTER PERFORMANCE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P0A78

Drive Motor 1 Inverter Performance

DTC P0A79

Drive Motor 2 Inverter Performance

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains the motor control modules and the hybrid/EV powertrain control module 1. Each motor control module operates its respective drive motor based upon hybrid/EV powertrain control module 1 commands. Each motor control module controls the speed, direction and output torque of its respective drive motor through the sequencing actuation of high current switching transistors called insulated gate bipolar transistors. Each drive motor operates utilizing 3-phase alternating current (AC) electricity. Each insulated gate bipolar transistor operates a single phase of the drive motor. Each phase is individually identified as U, V and W. Each motor control module monitors the current of each phase in order to detect power inverter module over current conditions.

Conditions for Running the DTC

The high voltage contactor relays are closed.

Conditions for Setting the DTC

The motor control module detects excessive current flow through the switched portion of the insulated gate bipolar transistor.

Actions Taken When the DTC Sets

- DTCs P0A78 and P0A79 are Type A DTCs.
- The power inverter module requests hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTCs P0A78 and P0A79 are Type A DTCs.

DTC P0AB9: HYBRID/EV SYSTEM PERFORMANCE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)

- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P0AB9

Hybrid/EV System Performance

Circuit/System Description

This vehicle does not use a 12 V starter motor to crank the internal combustion engine. A much more powerful 300 V motor located within the transmission is utilized to crank the engine. This motor, drive motor 1, can rotate the engine to operating speed within just a few hundred milliseconds. The hybrid/EV powertrain control module 1 can detect a condition where the engine is cranking but does not start or has stalled.

Conditions for Running the DTC

Drive motor 1 is cranking the engine.

Conditions for Setting the DTC

The hybrid/EV powertrain control module 1 detects that crankshaft position sensor engine speed has not risen above the commanded cranking speed indicating the engine has failed to start, or the hybrid/EV powertrain control module 1 detects crankshaft position sensor engine speed has fallen below a specific minimum speed indicating the engine has stalled.

Actions Taken When the DTC Sets

DTC P0AB9 is a Type A DTC.

Cranks But Does Not Start

When system commands engine Crank, the hybrid/EV powertrain control module 1 will command drive motor 1 to rotate the engine. The drive motor will continue to rotate the engine at a specific RPM until the engine starts and causes increased engine RPM. The hybrid/EV powertrain control module 1 will cease engine rotation if an increase in engine RPM is not observed after several seconds. This function may have the appearance of a start/stall condition.

- Commanded engine torque is greater than 20 N.m (15 lb ft)
- Low fuel level condition not set
- Fuel level sensors DTCs not set
- Engine CMP or CKP sensor DTCs not set
- DTC P16E0 not set

Engine Stall

If a stall occurs after a successful engine start, the hybrid/EV powertrain control module 1 will recognize the drop in engine RPM and command drive motor 1 to maintain engine RPM in an attempt to restart the engine. Drive motor 1 will continue to rotate the engine until the hybrid/EV powertrain control module 1 commands it to stop. The engine may be rotated for many minutes after the actual engine stall condition occurred and is typically stopped only after the hybrid/EV battery state of charge gets too low. This function may have the appearance of a running engine.

- Engine is running
- Low fuel level condition not set
- Fuel level sensors DTCs not set

- Engine CMP or CKP sensor DTCs not set
- DTC P16E0 not set

Conditions for Clearing the DTC

DTC P0AB9 is a Type A DTC.

Diagnostic Aids

Any condition that causes the engine to stall and/or not start may set this DTC. Possible conditions include:

- Fuel conditions such as low level, low pressure, or contamination
- Engine conditions such as low compression
- Restricted exhaust or air intake systems
- Loose or disconnected grounds

Always inspect for DTCs that would cause an engine stall and/or no start condition.

This DTC may set if the vehicle is powered off while driving.

Circuit/System Verification

1. Vehicle ON. Operate the hood release to open the hood. Under normal operation, the engine should start and run.
2. Verify the engine starts and runs for at least 20 seconds.

- **If the engine fails to start and run for at least 20 seconds**

Diagnose the engine and transmission systems. Perform Line Pressure Check. Refer to [Line Pressure Check](#).

- **If the engine starts and runs for at least 20 seconds**

3. Verify DTC P0AB9 is not set.

- **If the DTC is set**

1. Verify the T6 Power Inverter Module has the latest calibration in Calibration Information.

- If the T6 Power Inverter Module does not have the latest calibration, program the T6 power inverter module.
- If the T6 Power Inverter Module has the latest calibration, replace the T6 Power Inverter Module.

2. Verify the DTC does not set.

- If the DTC sets, replace the T6 Power Inverter Module.
- If the DTC does not set.

3. All OK

- **If the DTC is not set**

4. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Refer to [Control Module References](#) for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup

Circuit/System Description

This is an internal fault detection of the power inverter module, often referred to as the drive motor generator power inverter module. This fault is handled inside the power inverter module, and no external circuits are involved.

Conditions for Running the DTC

P0AEE, P0AF3, P0BD2, P0BD7, P0BDC, and P0BE1

- Vehicle ON after the vehicle has been OFF for 6 hours.
- Temperature average of the inverter phase temperature sensors is greater than -20°C (-4°F).
- DTCs P0AEF, P0AF0, P0AF4, P0AF5, P0BD3, P0BD4, P0BD8, P0BD9, P0BDD, P0BDE, P0BE2, and P0BE3 are not set.

P0AEF, P0AF4, P0BD3, P0BD8, P0BDD, and P0BE2

The vehicle is ON.

P0AF0, P0AF5, P0BD4, P0BD9, P0BDE, and P0BE3

- The vehicle is ON.
- Inverter warmup time is 90 s or greater.

Conditions for Setting the DTC

P0AEE, P0AF3, P0BD2, P0BD7, P0BDC, and P0BE1

A 20°C (36°F) difference is observed between the individual inverter phase temperature sensor and the average of the power electronics coolant and transmission fluid temperatures, at vehicle ON after a cold soak.

P0AEF, P0AF4, P0BD3, P0BD8, P0BDD, and P0BE2

The inverter phase temperature sensor is greater than 170°C (338°F) for 3 s.

P0AF0, P0AF5, P0BD4, P0BD9, P0BDE, and P0BE3

The inverter phase temperature sensor is less than -50°C (-58°F) for 2.6 s.

Actions Taken When the DTC Sets

DTCs P0AEE, P0AEF, P0AF0, P0AF3, P0AF4, P0AF5, P0BD2, P0BD3, P0BD4, P0BD7, P0BD8, P0BD9, P0BDC, P0BDD, P0BDE, P0BE1, P0BE2 and P0BE3 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0AEE, P0AEF, P0AF0, P0AF3, P0AF4, P0AF5, P0BD2, P0BD3, P0BD4, P0BD7, P0BD8, P0BD9, P0BDC, P0BDD, P0BDE, P0BE1, P0BE2 and P0BE3 are Type B DTCs.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P0AEE, P0AEF, P0AF0, P0AF3, P0AF4, P0AF5, P0BD2, P0BD3, P0BD4, P0BD7, P0BD8, P0BD9, P0BDC, P0BDD, P0BDE, P0BE1, P0BE2, or P0BE3 is not set.
 - **If any of the DTCs are set**
 1. Verify the T6 Power Inverter Module has the latest calibration in Calibration Information.
 - If the T6 Power Inverter Module does not have the latest calibration, program the T6 power inverter module.
 - If the T6 Power Inverter Module has the latest calibration, replace the T6 Power Inverter Module.
 2. Verify the DTC does not set.
 - If the DTC sets, replace the T6 Power Inverter Module.
 - If the DTC does not set.
 3. All OK.
 - **If none of the DTCs are set**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module replacement, programming, and setup

DTC P0B01, P0B04, OR P0B07: AUXILIARY TRANSMISSION FLUID PUMP LOW CURRENT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.

- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC P0B01

Auxiliary Transmission Fluid Pump Low Current

DTC P0B04

Auxiliary Transmission Fluid Pump Low Current

DTC P0B07

Auxiliary Transmission Fluid Pump Low Current

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains two motor control modules and the hybrid/EV powertrain control module 1. The motor control modules operate their respective drive motor based upon power inverter module commands. The hybrid/EV powertrain control module 1 controls the auxiliary transmission fluid pump. The pump motor utilizes 3 phase AC electricity. The motor stator coil is comprised of three phase circuits. The phase circuits are identified as phase U, phase V, and phase W. The U-V-W phase circuits are connected in a wye configuration. This means each phase is connected at a single, central point. The motor control modules monitor a current sensor connected to each motor phase. The current sensor is part of the power inverter module assembly and is not serviced separately. The hybrid/EV powertrain control module 1 is part of the power inverter module and is not serviced separately.

Conditions for Running the DTC

Vehicle is ON.

Conditions for Setting the DTC

One or more phase currents are less than 1 A.

Action Taken When the DTC Sets

- DTCs P0B01, P0B04, and P0B07 are Type A DTCs.
- Vehicle propulsion will be disabled.

Conditions for Clearing the DTC

DTCs P0B01, P0B04, and P0B07 are Type A DTCs.

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Perform the [High Voltage Disabling](#) procedure for servicing the T6 Power Inverter Module or T12 Transmission.
2. Remove the T6 Power Inverter Module cover. Refer to [Drive Motor Power Inverter Module Cover Replacement](#).
3. Disconnect the G5 transmission fluid pump high voltage AC 3 phase circuit harness connector at the rear of the T6 Power Inverter Module.
4. Test for infinite resistance between each of the AC circuit terminals listed below and ground for each phase of the G5 Transmission Fluid Pump - Electric/Auxiliary:
 - Terminal 3 phase U
 - Terminal 2 phase V
 - Terminal 1 phase W
 - **If less than infinite resistance**
 Replace the G5 Transmission Fluid Pump - Electric/Auxiliary.
 - **If infinite resistance**
5. With the pump at 25°C (77°F), test for 2.4 - 2.8 Ω between the AC circuit terminals listed below:
 - Terminal 3 phase U to terminal 2 phase V
 - Terminal 3 phase U to terminal 1 phase W
 - Terminal 2 phase V to terminal 1 phase W
 - **If not within the specified range**
 Replace the G5 Transmission Fluid Pump - Electric/Auxiliary.
 - **If within the specified range**
6. Replace the T6 Power Inverter Module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Automatic Transmission Fluid Pump and Fluid Filter Removal](#) for G5 Transmission Fluid Pump - Electric/Auxiliary, often referred to as the A/Trans Fluid Pump Motor, replacement
- Refer to [Control Module References](#) for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup

Circuit/System Description

This is an internal fault detection of the power inverter module, often referred to as the drive motor generator power inverter module. This fault is handled inside the drive motor generator power inverter module and no external circuits are involved.

Conditions for Running the DTC

The control module runs the program to detect an internal fault when the Hybrid wake-up circuit is active.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

Action Taken When the DTC Sets

- DTCs P0BE6, P0BE7, P0BE8, P0BEA, P0BEB, P0BEC, P0BEE, P0BEF, P0BF0, P0BF2, P0BF3, P0BF4, P0BF6, P0BF7, P0BF8, P0BFA, P0BFB and P0BFC are Type A DTCs.
- The power inverter module requests the hybrid powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTCs P0BE6, P0BE7, P0BE8, P0BEA, P0BEB, P0BEC, P0BEE, P0BEF, P0BF0, P0BF2, P0BF3, P0BF4, P0BF6, P0BF7, P0BF8, P0BFA, P0BFB and P0BFC are Type A DTCs.

DTC P0BFD OR P0BFE: DRIVE MOTOR 1-2 PHASES U-V-W NOT PLAUSIBLE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P0BFD

Drive Motor 1 Phases U-V-W Not Plausible

DTC P0BFE

Drive Motor 2 Phases U-V-W Not Plausible

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains the motor control modules and the hybrid/EV powertrain control module 1. Each motor control module operates its respective drive motor based upon hybrid/EV powertrain control module 1 commands. Each motor control module controls the speed, direction and output torque of its respective drive motor through the sequencing actuation of high current switching transistors called insulated gate bipolar transistors. Each drive motor operates utilizing 3-phase alternating current (AC) electricity. Each insulated gate bipolar transistor operates a single phase of the drive motor. Each phase is individually identified as U, V and W. Each motor control module monitors the current of each phase in order to detect power inverter module over current conditions.

Because all the motor generator phase circuits are electrically joined together, they should each flow about the same amount of current. The motor control modules perform a mathematical calculation to verify that the phase current sensors are accurate. If the U-V-W phase current sensors indicate about the same amount of phase current, the sum of the calculation should be near zero. If the U-V-W phase currents are not similar, this DTC will set.

Conditions for Running the DTC

- The vehicle is ON.
- The high voltage contactor relays are closed.

Conditions for Setting the DTC

The sum of the 3 phase current sensors is 110 A or greater.

Actions Taken When the DTC Sets

- DTCs P0BFD and P0BFE are Type A DTCs.
- The power inverter module requests the hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTCs P0BFD and P0BFE are Type A DTCs.

Circuit/System Verification

1. Vehicle ON.

2. Verify DTC P0BFD or P0BFE is not set.

- **If any of the DTCs are set**

1. Verify the T6 Power Inverter Module has the latest calibration in Calibration Information.

- If the T6 Power Inverter Module does not have the latest calibration, program the T6 power inverter module.
- If the T6 Power Inverter Module has the latest calibration, replace the T6 Power Inverter Module.

2. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

3. Verify the DTC does not set.

- If the DTC sets, continue to Circuit/System Testing.
- If the DTC does not set.

4. All OK.

- **If none of the DTCs are set**

3. All OK.

Circuit/System Testing

NOTE: Perform Circuit/System Verification before Circuit/System Testing.

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Perform the **High Voltage Disabling** procedure for servicing the T6 Power Inverter Module cable connections.
2. Remove the T6 Power Inverter Module. Refer to **Drive Motor Generator Power Inverter Module Replacement**.
3. Test for infinite resistance between each of the AC circuit terminals listed below and ground for each phase of the appropriate M15 Drive Motor:

Drive Motor 1

- Terminal 1B phase U
- Terminal 1A phase V
- Terminal 1C phase W

Drive Motor 2

- Terminal 2B phase U

- Terminal 2A phase V
- Terminal 2C phase W
- **If less than infinite resistance**

Replace the M15 Drive Motor.

- **If infinite resistance for all AC circuits**

4. Perform each of the operations listed below one at a time until the fault is corrected.

1. Replace the T6 Power Inverter Module.
2. Replace the M15 Drive Motor.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Drive Motor Removal - 1st Position](#) for Drive Motor 1 replacement
- Refer to [Drive Motor Removal - 2nd Position](#) for Drive Motor 2 replacement
- Refer to [Control Module References](#) for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains two drive motor control modules and the hybrid/EV powertrain control module 1. Each motor control module operates its respective drive motor based upon hybrid/EV powertrain control module 1 commands. Each motor control module controls the speed, direction and output torque of its respective drive motor through the sequencing actuation of high current switching transistors called insulated gate bipolar transistors. Each drive motor operates utilizing 3 phase AC. Each insulated gate bipolar transistor operates a single phase of the drive motor. Each phase is individually identified as U, V and W. Each motor control module monitors the temperature of each phase in order to detect power inverter module over-temperature conditions.

Conditions for Running the DTC

P0C11 - P0C16

Vehicle ON.

Conditions for Setting the DTC

The phase temperature has exceeded 131Â°C (268Â°F) for 5 seconds.

Action Taken When the DTC Sets

- DTCs P0C11, P0C12, P0C13, P0C14, P0C15 and P0C16 are Type A DTCs.
- The power inverter module requests the hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTCs P0C11, P0C12, P0C13, P0C14, P0C15 and P0C16 are Type A DTCs.

Reference Information

Description and Operation

- [Drive Motor Power Inverter Module Description and Operation](#)
- [Hybrid/EV Cooling System Description and Operation](#)

DTC Type Reference

[Powertrain Diagnostic Trouble Code \(DTC\) Type Definitions](#)

Circuit/System Verification

1. Vehicle ON, observe the scan tool ECM Engine Coolant Temperature (ECT) parameter in freeze frame data.
2. Verify the Engine Coolant Temperature parameter was below 125°C (257°F) when the DTC set.
 - **If the ECT was 125°C (257°F) or greater when the DTC set**
 Refer to [Symptoms - Engine Cooling](#) and correct that concern first.
 - **If the ECT was below 125°C (257°F) when the DTC set**
3. Inspect for proper coolant level in the hybrid cooling system reservoir.
 - **If coolant level is low**
 Refer to [Hybrid Cooling System Loss of Coolant \(Power Electronics\)](#) [Hybrid Cooling System Loss of Coolant \(Battery\)](#) .
 - **If coolant level is OK**
4. Inspect the hybrid/EV cooling system radiator for debris or obstruction.
 - **If a concern is found**
 Repair or replace the restricted or damaged components as necessary.
 - **If no concern is found**
5. Inspect for proper operation of all hybrid/EV system coolant pumps. Refer [Hybrid/EV Electronics Cooling Diagnostic](#) .
 - **If a concern is found**
 Repair or replace the coolant pumps as necessary.
 - **If no concern is found**
6. Command the cooling fans through all operating speeds.
 - **If the cooling fans do not operate in all speeds**
 Refer to [Hybrid/EV Electronics Cooling Diagnostic](#) .

- If the cooling fans operate in all speeds

7. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Refer to [Control Module References](#) for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup

DTC P0C17, P0C18, P1B0F, OR P1B10: DRIVE MOTOR 1-2 POSITION NOT LEARNED/LEARN INCORRECT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P0C17

Drive Motor 1 Position Not Learned

DTC P0C18

Drive Motor 2 Position Not Learned

DTC P1B0F

Drive Motor 1 Position Learn Incorrect

DTC P1B10

Drive Motor 2 Position Learn Incorrect

Circuit/System Description

The drive motor position sensor is monitored by the drive motor control module. The motor control module monitors the angular position, speed and direction of the drive motor rotor based upon the signals of the resolver-type position sensor. The position sensor contains a drive coil, two driven coils and an irregular shaped metallic rotor. The metallic rotor is mechanically attached to the shaft of the drive motor generator. At vehicle ON, the motor control module outputs a 7 V AC, 10 kHz excitation signal to the drive coil. The drive coil excitation signal creates a magnetic field surrounding the two driven coils and the irregular shaped rotor. The motor control module then monitors the two driven coil circuits for a return signal. The position of the irregular metallic rotor causes the magnetically-induced return signals of the driven coils to vary in size and shape. A comparison of the two driven coils signals allows the motor control module to determine the exact position, speed and direction of the drive motor rotor.

A measurement called offset is needed for accurate determination of the motor position. Offset is the relationship between the position sensor and the drive motor generator output shaft. Whenever the vehicle is cycled to OFF, the motor control module attempts to learn the offset of the drive motor position sensor by rapidly oscillating the motor and observing the position sensor signals.

The motor control module will attempt to learn the position at vehicle OFF. The non-learned condition would

normally occur only after a motor control module reprogramming event. The control modules listed below are part of the power inverter module, often referred to as the drive motor generator power inverter module, and are not serviced separately:

- Auxiliary transmission fluid pump control module
- Drive motor 1 control module
- Drive motor 2 control module
- Hybrid/EV powertrain control module 1

Conditions for Running the DTC

P0C17, P0C18

- Vehicle is cycled from ON to OFF.
- The motor control module has no valid drive motor position sensor offset value in memory.

P1B0F, P1B10

- Vehicle is cycled from ON to OFF.
- The motor control module has learned a valid drive motor position sensor offset value at least once.

Conditions for Setting the DTC

Condition 1

Position sensor offset value not learned because drive motor speed is greater than 50 RPM.

Condition 2

Position sensor offset value not learned because hybrid battery voltage as observed at the motor control module is less than 200 V.

Condition 3

- Position sensor offset value not learned because drive motor phase to phase current difference is less than 30 A.
- P1B0F or P1B10 failed to learn for 15 consecutive key cycle learn attempts.

Actions Taken When the DTC Sets

P0C17, P0C18

DTCs P0C17 and P0C18 are Type A DTCs.

P1B0F, P1B10

- DTCs P1B0F and P1B10 are Type B DTCs.
- The motor control module operates the drive motor generator using the last valid learned offset.

Conditions for Clearing the DTC

- DTCs P0C17 and P0C18 are Type A DTCs.
- DTCs P1B0F and P1B10 are Type B DTCs.

Diagnostic Aids

- If the vehicle is powered off while driving, DTC P1B0F or P1B10 may set.
- The drive motor position sensor circuits operate at very low current. These circuits are susceptible to moisture intrusion, corrosion, and terminal damage. Extreme care must be taken when probing terminals and manipulating harnesses. Poor terminal connections can result in intermittent operation.
- Intermittent appearance of DTC P0A3F, P0A40, P0C52, P0C53, P0C5C, P0C5D, or P1B03 for drive motor 1 or DTC P0A45, P0A46, P0C57, P0C58, P0C61, P0C62, or P1B04 for drive motor 2 suggests intermittent position sensor circuit or connector problems.

Reference Information

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle ON.
2. Verify that DTCs P0A3F, P0A40, P0A45, P0A46, P0A78, P0A79, P0C01, P0C04, P0C0B, P0C0E, P0C4E, P0C4F, P0C52, P0C53, P0C57, P0C58, P0C5C, P0C5D, P0C61, P0C62, P1B03, P1B04, P1B0D, or P1B0E is not set.

- **If any of the DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If none of the DTCs are set**

NOTE: **When turning vehicle OFF, open and close the driver door and wait 2 minutes to allow all modules to shut down.**

3. Cycle vehicle power 4 times, using a scan tool to monitor the state of the appropriate Drive Motor Position Sensor Offset Learn Status.

- **If Drive Motor Position Sensor Offset Learn Status showed Motor Current Incorrect all 4 cycles**

Refer to Circuit/System Testing.

- **If Drive Motor Position Sensor Offset Learn Status did not show Motor Current Incorrect all 4 cycles**

4. Vehicle ON.
5. Verify DTC P0C17, P0C18, P1B0F, or P1B10 is not set.

- **If any of the DTCs are set**

1. Verify the T6 Power Inverter Module has the latest calibration in Calibration Information.

- If the T6 Power Inverter Module does not have the latest calibration, program the T6 power inverter module.
- If the T6 Power Inverter Module has the latest calibration, replace the T6 Power Inverter Module.

2. Cycle vehicle power 4 times, using a scan tool to monitor the state of the appropriate Drive Motor Position Sensor Offset Learn Status.

3. Verify the DTC does not set.

- If the DTC sets, replace the T6 Power Inverter Module.
- If the DTC does not set

4. All OK.

- If none of the DTCs are set

6. All OK.

Circuit/System Testing

NOTE: You must perform the Circuit/System Verification before proceeding with Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Perform the High Voltage Disabling procedure for servicing the T6 Power Inverter Module or T12 Transmission.
2. Remove the T6 Power Inverter Module. Refer to Drive Motor Generator Power Inverter Module Replacement.
3. Test for infinite resistance between each of the AC circuit terminals listed below and ground for each phase of the appropriate M15 Drive Motor:

Drive Motor 1

- Terminal 1B phase U
- Terminal 1A phase V
- Terminal 1C phase W

Drive Motor 2

- Terminal 2B phase U
- Terminal 2A phase V
- Terminal 2C phase W
- If less than infinite resistance

Replace the M15 Drive Motor.

- If infinite resistance for all AC circuits

4. Verify the DTC does not set.

- If the DTC sets

1. Perform each of the operations listed below one at a time until the fault is corrected.
 1. Replace the T6 Power Inverter Module.
 2. Replace the appropriate M15 Drive Motor.

2. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
3. Repeat the DTC check.

- **If the DTC does not set**

5. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- Refer to [Drive Motor Removal - 1st Position](#) for K107A Drive Motor 1 replacement
- Refer to [Drive Motor Removal - 2nd Position](#) for K107B Drive Motor 2 replacement
- Refer to [Control Module References](#) for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup.

DTC P0C19: DRIVE MOTOR 1 TORQUE DELIVERED PERFORMANCE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P0C19

Drive Motor 1 Torque Delivered Performance

Circuit/System Description

Each drive motor is controlled by a motor control module. The motor control module constantly monitors the requested torque and the delivered torque of its respective drive motor. The motor control module is part of the power inverter module, often referred to as the drive motor generator power inverter module, and is not serviced separately.

Conditions for Running the DTC

- DTCs P0A3F, P0A40, P1AF5, P0BFD, P1B03, P1B0C or P16EB is not set.
- Vehicle ON.
- Drive motor 1 is commanded to develop torque.

Conditions for Setting the DTC

The motor control module has detected that difference between drive motor delivered and commanded torque is greater than 123 N.m (91 lb ft).

Actions Taken When the DTC Sets

- DTC P0C19 is a Type A DTC.
- The hybrid/EV powertrain control module 1 requests the hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTC P0C19 is a Type A DTC.

Diagnostic Aids

Because the engine and drive motor 1 are mechanically connected through a planetary gear set, an engine condition that requires drive motor 1 to consume excessive current while trying to rotate the engine may cause this DTC to set such as:

- Extreme braking during regeneration may cause this DTC to be set in history.
- Seized or binding engine
- Seized or binding accessory drive belt

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Vehicle ON. Operate the hood release to open the hood. The engine should start and run.
2. Verify the engine is not seized or binding.
 - **If the engine is seized or binding**
Refer to [Symptoms - Engine Mechanical](#) .
 - **If the engine is not seized or binding**
3. Verify DTC P0C19 is not set.
 - **If the DTC is set**
 1. Verify the T6 Power Inverter Module has the latest calibration in Calibration Information.
 - If the T6 Power Inverter Module does not have the latest calibration, program the T6 power inverter module.
 - If the T6 Power Inverter Module has the latest calibration, replace the T6 Power Inverter Module.
 2. Verify the DTC does not set.
 - If the DTC sets, replace the T6 Power Inverter Module.
 - If the DTC does not set.
 3. All OK
 - **If the DTC is not set**
4. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Refer to [Control Module References](#) for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup.

DTC P0C1A: DRIVE MOTOR 2 TORQUE DELIVERED PERFORMANCE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P0C1A

Drive Motor 2 Torque Delivered Performance

Circuit/System Description

Each drive motor is controlled by a motor control module. The motor control module constantly monitors the requested torque and the delivered torque of its respective drive motor. The motor control module is part of the power inverter module, often referred to as the drive motor generator power inverter module, and is not serviced separately.

Conditions for Running the DTC

- Vehicle ON.
- DTCs P0A3F, P0A40, P1AF5, P0BFD, P1B03, P1B0C, P1B41, or P16EB is not set.
- Drive motor 2 is commanded to develop torque.

Conditions for Setting the DTC

The motor control module has detected that difference between drive motor delivered and commanded torque is greater than 132 N.m (97 lb ft).

Actions Taken When the DTC Sets

- DTC P0C1A is a Type A DTC.
- The hybrid/EV powertrain control module 1 requests the hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTC P0C1A is a Type A DTC.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P0C1A is not set.
 - **If the DTC is set**
 1. Verify the T6 Power Inverter Module has the latest calibration in Calibration Information.
 - If the T6 Power Inverter Module does not have the latest calibration, program the T6 power inverter module.
 - If the T6 Power Inverter Module has the latest calibration, replace the T6 Power Inverter Module.

2. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
3. Verify the DTC does not set.
 - If the DTC sets, replace the T6 Power Inverter Module.
 - If the DTC does not set.
4. All OK
 - **If the DTC is not set**

3. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Refer to [Control Module References](#) for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup

DTC P0C28: AUXILIARY TRANSMISSION FLUID PUMP HIGH CURRENT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P0C28

Auxiliary Transmission Fluid Pump High Current

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains two motor control modules and the hybrid/EV powertrain control module 1. The motor control modules operate their respective drive motor based upon power inverter module commands. The hybrid/EV powertrain control module 1 controls the auxiliary transmission fluid pump. The motors utilize 3 phase AC electricity. The motor stator coil is comprised of three phase circuits. The phase circuits are identified as phase U, phase V, and phase W. The U-V-W phase circuits are connected in a wye configuration. This means each phase is connected at a single, central point. The motor control modules monitor a current sensor connected to each motor phase. The current sensor is part of the motor assembly and is not serviced separately. The hybrid/EV powertrain control module 1 is part of the power inverter module and are not serviced separately.

Conditions for Running the DTC

Vehicle is ON.

Conditions for Setting the DTC

One or more phase currents are greater than 35 A.

Actions Taken When the DTC Sets

- DTC P0C28 is a Type A DTC.

- Vehicle propulsion will be disabled.

Conditions for Clearing the DTC

DTC P0C28 is a Type A DTC.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Perform the High Voltage Disabling procedure for servicing the T6 Power Inverter Module or T12 Transmission.
2. Disconnect the X8 harness connector at the T6 Power Inverter Module.
3. Test for infinite resistance between each of the AC circuit terminals listed below and ground for each phase of the G5 Transmission Fluid Pump - Electric/Auxiliary:
 - Terminal 3 phase U
 - Terminal 2 phase V
 - Terminal 1 phase W
 - **If less than infinite resistance**

Replace the G5 Transmission Fluid Pump - Electric/Auxiliary.

- **If infinite resistance**

4. Replace the T6 Power Inverter Module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Automatic Transmission Fluid Pump and Fluid Filter Removal](#) for G5 Transmission Fluid Pump - Electric/Auxiliary replacement
- Refer to [Control Module References](#) for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup

DTC P0C4E: DRIVE MOTOR 1 POSITION EXCEEDED LEARNING LIMIT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P0C4E

Drive Motor 1 Position Exceeded Learning Limit

Circuit/System Description

The drive motor position sensor is monitored by the drive motor control module. The motor control module monitors the angular position, speed and direction of the drive motor rotor based upon the signals of the resolver-type position sensor. The position sensor contains a drive coil, two driven coils and an irregular shaped metallic rotor. The metallic rotor is mechanically attached to the shaft of the drive motor generator. At vehicle ON, the motor control module outputs a 7 V AC, 10 kHz excitation signal to the drive coil. The drive coil excitation signal creates a magnetic field surrounding the two driven coils and the irregular shaped rotor. The motor control module then monitors the two driven coil circuits for a return signal. The position of the irregular metallic rotor causes the magnetically-induced return signals of the driven coils to vary in size and shape. A comparison of the two driven coils signals allows the motor control module to determine the exact position, speed and direction of the drive motor rotor.

A measurement called offset is needed for accurate determination of the motor position. Offset is the relationship between the position sensor and the drive motor generator output shaft. Whenever the vehicle is cycled to OFF, the motor control module attempts to learn the offset of the drive motor position sensor by rapidly oscillating the motor and observing the position sensor signals.

The control modules listed below are part of the power inverter module, often referred to as the drive motor generator power inverter module, and are not serviced separately:

- Auxiliary transmission fluid pump control module
- Drive motor 1 control module
- Drive motor 2 control module
- Hybrid/EV powertrain control module 1

Conditions for Running the DTC

- The vehicle is cycled OFF.

- Offset Learn has completed.

Conditions for Setting the DTC

- The position sensor total offset exceeds 30 degrees during the learning process.

OR

- The current learned value differs from the previous learned value by greater than 10 degrees.

Actions Taken When the DTC Sets

DTC P0C4E is a Type A DTC.

Conditions for Clearing the DTC

DTC P0C4E is a Type A DTC.

Diagnostic Aids

This DTC sets when the drive motor control module is unable to learn the position of the drive motor. When this DTC sets, or after replacement of a drive motor position sensor, drive motor, or power inverter module, it is possible that a special wide angle learn needs to occur. This wide angle learn occurs when the drive motor control module sees a programming event on the High Speed GMLAN bus.

For intermittent appearance of DTCs:

- The drive motor position sensor circuits operate at very low current. These circuits are susceptible to moisture intrusion, corrosion, and terminal damage. Extreme care must be taken when probing terminals and manipulating harnesses. Poor terminal connections can result in intermittent operation.
- If the customer comments that the problem occurs only during moist environmental conditions: rain, snow, vehicle wash, etc., inspect the sensor wiring for signs of water intrusion.
- Intermittent appearance of DTC P0A3F, P0A40, P0C52, P0C53, P0C5C, P0C5D, or P1B03 suggests intermittent position sensor circuit or connector problems.
- Drive motor control modules 1 and 2 monitor and report their respective Drive Motor Position Sensor Offset Learn Status. This information can be observed using a scan tool. Status is updated during the transition from vehicle ON to vehicle OFF during normal conditions. Alternating, and possibly intermittent, appearance of "Not Run," "Learn Failed Motor Speed Not Zero," and "Motor Current Incorrect" suggests intermittent position sensor circuit or connector problems.

Drive Motor 1/2 Position Sensor Offset Learn Status Parameter Descriptions

Drive Motor Position Sensor Offset Learn Status	Description	May Be Caused By
Not Run	Not run yet, waiting for key off	Not Applicable
	Aborted run due to detecting high voltage too low or motor speed too high	Key off while rolling, drive motor position sensor circuit problems, or high voltage system problems
	Ran but failed due to out of range values	Resolver or drive motor problems
Learn Successful	Position offset learned and stored successfully	Not Applicable
Learn Failed Motor Speed Not Zero	Speed high during offset learn but not before	Drive motor position sensor circuit problems

Drive Motor Position Sensor Offset Learn Status	Description	May Be Caused By
Learn Failed - High Voltage Too Low	High voltage contactors opened during offset learn	High voltage system problems
Motor Current Incorrect	Low current on 3-phase circuits between power inverter module and drive motor	Drive motor or power inverter module

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P0A3F, P0A40, P0C52, P0C53, P0C5C, P0C5D, or P1B03 is not set.
 - **If any of the DTCs are set**

Refer to [DTC P0A3F, P0A40, P0C52, P0C53, P0C5C, P0C5D, or P1B03](#).

- **If none of the DTCs are set**
3. Verify DTC P0C4E is not set.
 - **If the DTC sets**

NOTE:

A current DTC indicates that the Motor Control Module cannot learn the motor position. Programming any module on the High Speed GMLAN bus will initiate a Motor Control Module wide angle learn. If current T6 Power Inverter Module software is already up-to-date, then programming will not take place and the wide angle learn will not be initiated. Program a different module, such as the ECM, to initiate the wide angle learn. If necessary, the majority of modules can be forced to reprogram using the SPS Replace and Program option.

1. Perform each of the operations listed below one at a time until the fault is corrected.
 1. Program the T6 Power Inverter Module or another High Speed GMLAN module if software is already up-to-date.

NOTE:

Check for physical damage on the position sensor and drive motor

rotor and replace any damaged component first.

2. Replace the B228A Drive Motor 1 Position Sensor, and if the DTC still sets, program a module to initiate wide angle learn.
3. Replace the M15A Drive Motor 1, and if the DTC still sets, program a module to initiate wide angle learn.
4. Replace and program the T6 Power Inverter Module.

2. Repeat the DTC check in step 3.

- **If the DTC does not set**

4. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Drive Motor Disassemble - 1st Position](#) for B228A Drive Motor 1 Position Sensor, often referred to as the Generator Position Sensor Stator (Unit A), replacement
- Refer to [Drive Motor Removal - 1st Position](#) , and [Drive Motor Installation - 1st Position](#) for Drive Motor 1 replacement
- Refer to [Control Module References](#) for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup

DTC Descriptor

DTC P0C4F

Drive Motor 2 Position Exceeded Learning Limit

Circuit/System Description

The drive motor position sensor is monitored by the drive motor control module. The motor control module monitors the angular position, speed and direction of the drive motor rotor based upon the signals of the resolver-type position sensor. The position sensor contains a drive coil, two driven coils and an irregular shaped metallic rotor. The metallic rotor is mechanically attached to the shaft of the drive motor generator. At vehicle ON, the motor control module outputs a 7 V AC, 10 kHz excitation signal to the drive coil. The drive coil excitation signal creates a magnetic field surrounding the two driven coils and the irregular shaped rotor. The motor control module then monitors the two driven coil circuits for a return signal. The position of the irregular metallic rotor causes the magnetically-induced return signals of the driven coils to vary in size and shape. A comparison of the two driven coils signals allows the motor control module to determine the exact position, speed and direction of the drive motor rotor.

A measurement called offset is needed for accurate determination of the motor position. Offset is the relationship between the position sensor and the drive motor generator output shaft. Whenever the vehicle is cycled to OFF, the motor control module attempts to learn the offset of the drive motor position sensor by rapidly oscillating the motor and observing the position sensor signals.

The control modules listed below are part of the power inverter module, often referred to as the drive motor generator power inverter module, and are not serviced separately:

- Auxiliary transmission fluid pump control module
- Drive motor 1 control module
- Drive motor 2 control module
- Hybrid/EV powertrain control module 1

Conditions for Running the DTC

- The vehicle is cycled OFF.
- Offset learn has completed.

Conditions for Setting the DTC

- The position sensor offset total exceeds 30 degrees during the learning process.

OR

- The current learned value differs from the previous learned value by greater than 10 degrees.

Actions Taken When the DTC Sets

DTC P0C4F is a Type A DTC.

Conditions for Clearing the DTC

DTC P0C4F is a Type A DTC.

Diagnostic Aids

This DTC sets when the drive motor control module is unable to learn the position of the drive motor. When this DTC sets, or after replacement of a drive motor position sensor, drive motor, or power inverter module, it is possible that a special wide angle learn needs to occur. This wide angle learn occurs when the drive motor control module sees a programming event on the High Speed GMLAN bus.

For intermittent appearance of DTCs:

- The drive motor position sensor circuits operate at very low current. These circuits are susceptible to moisture intrusion, corrosion, and terminal damage. Extreme care must be taken when probing terminals and manipulating harnesses. Poor terminal connections can result in intermittent operation.
- If the customer comments that the problem occurs only during moist environmental conditions: rain, snow, vehicle wash, etc., inspect the sensor wiring for signs of water intrusion.
- Intermittent appearance of DTC P0A45, P0A46, P0C57, P0C58, P0C61, P0C62, or P1B04 suggests intermittent position sensor circuit or connector problems.
- Drive motor control modules 1 and 2 monitor and report their respective Drive Motor Position Sensor Offset Learn Status. This information can be observed using a scan tool. Status is updated during the transition from vehicle ON to vehicle OFF during normal conditions. Alternating or intermittent display of "Not Run," "Learn Failed Motor Speed Not Zero," and "Motor Current Incorrect" suggests intermittent position sensor circuit or connector problems.

Drive Motor 1/2 Position Sensor Offset Learn Status Parameter Descriptions

Drive Motor Position Sensor Offset Learn Status	Description	May Be Caused By
---	-------------	------------------

Drive Motor Position Sensor Offset Learn Status	Description	May Be Caused By
Not Run	Not run yet, waiting for key off	Not Applicable
	Aborted run due to detecting high voltage too low or motor speed too high	Key off while rolling, drive motor position sensor circuit problems, or high voltage system problems
	Ran but failed due to out of range values	Resolver or drive motor problems

2. Verify DTC P0A45, P0A46, P0C57, P0C58, P0C61, P0C62, or P1B04 is not set.
 - **If any of the DTCs are set**

Refer to [DTC P0A45, P0A46, P0C57, P0C58, P0C61, P0C62, or P1B04.](#)

- **If none of the DTCs are set**
3. Verify DTC P0C4F is not set.
 - **If the DTC sets**

NOTE:

A current DTC indicates that the Motor Control Module cannot learn the motor position. Programming any module on the High Speed GMLAN bus will initiate a Motor Control Module wide angle learn. If current T6 Power

Inverter Module software is already up-to-date, then programming will not take place and the wide angle learn will not be initiated. Program a different module, such as the ECM, to initiate the wide angle learn. If necessary, the majority of modules can be forced to reprogram using the SPS Replace and Program option.

1. Perform each of the operations listed below one at a time until the fault is corrected.

1. Program the T6 Power Inverter Module or another High Speed GMLAN module if software is already up-to-date.

NOTE: Check for physical damage on the position sensor and drive motor rotor and replace any damaged component first.

2. Replace the B228B Drive Motor 2 Position Sensor, and if the DTC still sets, program a module to initiate wide angle learn.
3. Replace the M15B Drive Motor 2, and if the DTC still sets, program a module to initiate wide angle learn.
4. Replace and program the T6 Power Inverter Module.

2. Repeat the DTC check in step 3.

- If the DTC does not set

4. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Drive Motor Disassemble - 2nd Position](#) for B228B Drive Motor 2 Position Sensor replacement
- Refer to [Drive Motor Removal - 2nd Position](#) , and [Drive Motor Installation - 2nd Position](#) for Drive Motor 2 replacement
- Refer to [Control Module References](#) for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup

DTC P0C76: HYBRID/EV BATTERY SYSTEM HIGH VOLTAGE PRESENT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P0C76

Hybrid/EV Battery System High Voltage Present

Circuit/System Description

The hybrid/EV battery pack contains 4 high voltage contactors and 1 solid state relay (transistor). The high voltage contactors allow the high voltage DC to be connected to the vehicle or safely contained within the hybrid/EV battery pack. The 4 high voltage contactors are a main positive high voltage contactor, main negative high voltage contactor,

charge positive high voltage contactor, and a precharge negative high voltage contactor. The transistor controls the battery heater high voltage positive circuit.

Conditions for Running the DTC

- High voltage contactors are commanded open.
- The system voltage is at least 10 V.

Conditions for Setting the DTC

The high voltage bus voltage is greater than 200 V 3.5 seconds after the contactors have been commanded open.

Action Taken When the DTC Sets

DTC P0C76 is a Type A DTC.

Conditions for Clearing the DTC

- DTC P0C76 is a Type A DTC.
- The Clear Secured High Voltage DTCs reset function must be performed to prevent resetting the DTC.

Reference Information

Schematic Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Verify the contactors are operating normally.
 - **If the contactors are not operating properly**
Repair as necessary.
 - **If the contactors are operating properly**
2. Vehicle ON.
3. With a scan tool, perform the Clear Secured High Voltage DTCs reset function.
4. Verify DTC P0C76 is not set.
 - **If the DTC is set**
Replace the T6 Power Inverter Module.
 - **If the DTC is not set**
5. All OK

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: Diagnostic Repair Verification

Refer to Control Module References for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup

DTC P150D OR P150E: SUPPLY VOLTAGE CIRCUIT(S) 1-2 LOW VOLTAGE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P150D

Supply Voltage Circuit 2 Low Voltage

DTC P150E

Supply Voltage Circuit 1 Low Voltage

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains three motor control modules and the hybrid/EV powertrain control module 1. Two of the motor control modules operate their respective drive motor based upon power inverter module commands. The third motor control module controls the auxiliary transmission fluid pump. The hybrid/EV powertrain control module 1 and the motor control modules share the power inverter module ignition voltage circuit, battery voltage circuits and chassis ground.

Conditions for Running the DTC

The vehicle is ON.

Conditions for Setting the DTC

P150D

Battery voltage on circuit 2 is less than 8.0 V for more than 2.5 s.

P150E

Battery voltage on circuit 1 is less than 8.0 V for more than 2.5 s.

Action Taken When the DTC Sets

DTC P150D and P150E are Type C DTCs.

Conditions for Clearing the DTC

DTC P150D and P150E are Type C DTCs.

1. Vehicle ON.
2. Verify DTC P0562 or P0563 is not set.

- **If any of the DTCs are set**

Refer to [DTC B1325, B1330, B1517, C0800, C0899, C0900, C12E1, C12E2, P0561-P0563, P1A0C, P1A0D, or P1EFC](#).

- **If none of the DTCs are set**

3. Verify DTC P150D or P150E is not set.

- **If DTC P150D is set**

1. Vehicle OFF, disconnect the X1 harness connector at the T6 Power Inverter Module.
2. Verify a test lamp illuminates between the B+ circuit terminal 50 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Remove the test lamp.
2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Remove the test lamp.
2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the T6 Power Inverter Module.

- **If the test lamp illuminates**

3. Verify the T6 Power Inverter Module has the latest calibration in Calibration Information.

- If the T6 Power Inverter Module does not have the latest calibration, program the T6 power inverter module.
- If the T6 Power Inverter Module has the latest calibration, replace the T6 Power Inverter Module.

4. Verify the DTC does not set.

- If the DTC sets, replace the T6 Power Inverter Module.
- If the DTC does not set

5. All OK.

- **If DTC P150E is set**

1. Vehicle OFF, disconnect the X1 harness connector at the T6 Power Inverter Module.
2. Verify a test lamp illuminates between the B+ circuit terminal 2 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Remove the test lamp.
2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
- **If the test lamp does not illuminate and the circuit fuse is open**
1. Remove the test lamp.
2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the T6 Power Inverter Module.
 - **If the test lamp illuminates**
3. Verify the T6 Power Inverter Module has the latest calibration in Calibration Information.
 - If the T6 Power Inverter Module does not have the latest calibration, program the T6 power inverter module.
 - If the T6 Power Inverter Module has the latest calibration, replace the T6 Power Inverter Module.
4. Verify the DTC does not set.
 - If the DTC sets, replace the T6 Power Inverter Module.
 - If the DTC does not set
5. All OK.
- **If none of the DTCs are set**
4. All OK.

DTC P15F0: ENGINE TORQUE DELIVERED SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P15F0

Engine Torque Delivered Signal Message Counter Incorrect

Circuit/System Description

This diagnostic applies to internal microprocessor integrity conditions within the hybrid/EV powertrain control module 1. The hybrid/EV powertrain control module 1 is internal to the power inverter module, often referred to as the drive motor generator power inverter module, and is not serviced separately. The hybrid/EV powertrain control module 1 monitors its ability to read and write to the memory. The hybrid/EV powertrain control module 1 processor monitors the data to verify that the indicated engine torque delivered calculation is correct.

Conditions for Running the DTC

- Vehicle is ON.
- Run/Crank is 9.5 V or greater.

OR

Ignition Run/Crank is 11 V or greater.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

Action Taken When the DTC Sets

- DTC P15F0 is a Type A DTC.
- The hybrid/EV powertrain control module 1 requests the hybrid powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTC P15F0 is a Type A DTC.

Reference Information

DTC P15F1: AXLE TORQUE REQUEST SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P15F1

Axle Torque Request Signal Message Counter Incorrect

Circuit/System Description

This diagnostic applies to internal microprocessor integrity conditions within the hybrid/EV powertrain control module 1. The hybrid/EV powertrain control module 1 is internal to the power inverter module, often referred to as the drive motor generator power inverter module, and is not serviced separately. The hybrid/EV powertrain control module 1 monitors its ability to read and write to the memory. The hybrid/EV powertrain control module 1 processor monitors the data to verify that the indicated axle torque requested calculation is correct.

Conditions for Running the DTC

- Vehicle is ON.
- The run/crank voltage is 9.5 V or greater.

OR

The ignition run/crank voltage is 11 V or greater.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

Action Taken When the DTC Sets

- DTC P15F1 is a Type A DTC.
- The hybrid/EV powertrain control module 1 requests the hybrid powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTC P15F1 is a Type A DTC.

Reference Information

 - **If the DTC is set**
 1. Verify the T6 Power Inverter Module has the latest calibration in Calibration Information.

- If the T6 Power Inverter Module does not have the latest calibration, program the T6 power inverter module.
 - If the T6 Power Inverter Module has the latest calibration, replace the T6 Power Inverter Module.
2. Verify the DTC does not set.
- If the DTC sets, replace the T6 Power Inverter Module.
 - If the DTC does not set.
3. All OK
- **If the DTC is not set**
3. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Refer to [Control Module References](#) for T6 Power Inverter Module, often referred to as Drive Motor Generator Power Inverter Module, replacement, programming, and setup

DTC P15F2: ENGINE TORQUE COMMAND SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P15F2

Engine Torque Command Signal Message Counter Incorrect

Circuit/System Description

This diagnostic applies to internal microprocessor integrity conditions within the engine control module (ECM). The hybrid/EV powertrain control module 1 is internal to the power inverter module, often referred to as the drive motor generator power inverter module, and is not serviced separately. The hybrid/EV powertrain control module 1 sends an engine torque requested message to the ECM over the serial data circuits. The ECM monitors the data to verify the indicated engine torque requested calculation is correct. The ECM processor monitors the data to verify that the engine torque command is correct.

Conditions for Running the DTC

- Vehicle is ON.
- The system voltage is 8 - 18 V.
- DTC U1817 is not set.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

Action Taken When the DTC Sets

- DTC P15F2 is a Type A DTC.

- The hybrid/EV powertrain control module 1 requests the hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTC P15F2 is a Type A DTC.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

NOTE: Diagnose and repair any communication DTCs prior to performing this testing.

1. Vehicle ON.
2. Verify DTC P15F2 is not set.
 - **If the DTC is set**
 1. Verify the K20 ECM has the latest calibration in Calibration Information.
 - If the K20 ECM does not have the latest calibration, program the K20 ECM.
 - If the K20 ECM has the latest calibration, replace the K20 ECM.
 2. Verify the DTC does not set.
 - If the DTC sets, replace the K20 ECM.
 - If the DTC does not set.
 3. All OK
 - **If the DTC is not set**
3. All OK

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Refer to Control Module References for K20 ECM replacement, programming, and setup

DTC P15FC: HYBRID/EV BATTERY CONTACTOR STATUS MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: Diagnostic System Check - Vehicle
- Review the description of Strategy Based Diagnosis: Strategy Based Diagnosis
- An overview of each diagnostic category can be found here: Diagnostic Procedure Instructions

DTC Descriptor

DTC P15FC

Hybrid/EV Battery Contactor Status Message Counter Incorrect

Circuit/System Description

This diagnostic applies to internal microprocessor integrity conditions within the hybrid/EV powertrain control module 1. The hybrid/EV powertrain control module 1 is internal to the power inverter module, often referred to as the drive motor generator power inverter module, and is not serviced separately. The hybrid/EV powertrain control module 1 monitors its ability to read and write to the memory. The hybrid/EV powertrain control module 1 processor monitors the data to verify that the indicated contactor closure status is correct.

Conditions for Running the DTC

The vehicle is ON for 1 second.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

Actions Taken When the DTC Sets

- DTC P15FC is a Type A DTC.
- The hybrid/EV powertrain control module 1 requests the hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTC P15FC is a Type A DTC.

Reference Information

DTC P16E0: ENGINE PERFORMANCE - NO TORQUE DETECTED

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P16E0

Engine Performance - No Torque Detected

Circuit/System Description

This vehicle does not use a 12 V starter motor to crank the internal combustion engine. A much more powerful 300 V motor located within the transmission is utilized to crank the engine. This motor, drive motor 1, can rotate the engine to operating speed within just a few hundred milliseconds. The hybrid/EV powertrain control module 1 can detect a condition where the engine is cranking but does not start or has stalled.

Conditions for Running the DTC

- The vehicle is ON.
- DTC U0100 is not set.
- Engine running.
- Fuel Level is NOT Low.
- No Fuel Level sensor DTCs set.
- Commanded engine torque is 50 or greater.

Conditions for Setting the DTC

The difference between commanded engine torque and delivered engine torque is 50 or greater for 3.5 seconds out of a 4 second window.

Action Taken When the DTC Sets

DTC P16E0 is a Type A DTC.

Conditions for Clearing the DTC

DTC P16E0 is a Type A DTC.

Diagnostic Aids

Any condition that causes the engine to stall and/or not start may set this DTC. Possible conditions include:

- Fuel conditions such as low pressure or contamination.
- Engine conditions such as low compression.
- Restricted exhaust or air intake systems.

Always inspect for DTCs that would cause an engine stall and/or no start condition.

Circuit/System Verification

1. Vehicle ON. Operate the hood release to open the hood. The engine should start and run.
2. Verify the engine starts.
 - **If the engine fails to start**

Diagnose the engine system. Refer to [Engine Cranks But Does Not Run](#) .

- **If the engine starts**
3. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

DTC P16F3: CONTROL MODULE REDUNDANT MEMORY PERFORMANCE (HYBRID/EV POWERTRAIN CONTROL MODULE 1)

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P16F3

Control Module Redundant Memory Performance

Circuit/System Description

This diagnostic applies to internal microprocessor integrity conditions within the hybrid/EV powertrain control module 1. The hybrid/EV powertrain control module 1 is internal to the power inverter module, often referred to as the drive motor generator power inverter module, and is not serviced separately. The hybrid/EV powertrain control module 1 monitors its ability to read and write to the memory. The hybrid/EV powertrain control module 1 processor stores identical data in two locations and compares the data to verify that the stored data is correct.

Conditions for Running the DTC

The system voltage is 11 V or greater.

Conditions for Setting the DTC

The control module has detected that data identical when stored is not the same when retrieved.

Action Taken When the DTC Sets

- DTC P16F3 is a Type A DTC.
- The hybrid/EV powertrain control module 1 requests the hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTC P16F3 is a Type A DTC.

Reference Information

3. Verify DTC P16F3 is not set.
 - **If the DTC is set**
 1. Verify the T6 Power Inverter Module has the latest calibration in Calibration Information.
 - If the T6 Power Inverter Module does not have the latest calibration, program the T6 power inverter module.
 - If the T6 Power Inverter Module has the latest calibration, replace the T6 Power Inverter Module.
 2. Verify the DTC does not set.
 - If the DTC sets, replace the T6 Power Inverter Module.
 - If the DTC does not set.
 3. All OK
 - **If the DTC is not set**
4. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Refer to [Control Module References](#) for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup.

DTC P16F4: CONTROL MODULE TRANSMISSION RANGE SWITCH INPUT CIRCUITRY PERFORMANCE (HYBRID/EV POWERTRAIN CONTROL MODULE 1)

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.

- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P16F4

Control Module Transmission Range Switch Input Circuitry Performance

Circuit/System Description

The transmission internal mode switch, often referred to as the automatic transmission manual shift shaft position switch, is a hall-effect switch attached to the transmission case within the transmission. The 5 outputs from the switch indicate which position is selected by the transmission manual shaft. Five outputs (A, B, C, P, S) are range selection inputs to the hybrid/EV powertrain control module 1. The input voltage at the modules is high when the switch is open and low when the switch is closed to ground. The state of each input is displayed on the scan tool as Internal Mode Switch A/B/C/P/S. The Internal Mode Switch Range input parameters represented are transmission range signal A, signal B, signal C, and signal P signal S. The hybrid/EV powertrain control module 1 is internal to the power inverter module, often referred to as the drive motor generator power inverter module, and is not serviced separately.

Conditions for Running the DTC

- The vehicle is ON.
- Ignition voltage is greater than 9.5 V.

Conditions for Setting the DTC

The control module has detected the commanded transmission range state is not correct based upon internal calculations or by a comparison to input or output torque conditions.

Action Taken When the DTC Sets

- DTC P16F4 is a Type A DTC.
- Vehicle propulsion will be disabled. The hybrid/EV powertrain control module 1 requests the hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTC P16F4 is a Type A DTC.

[DTC Descriptor](#)

DTC P16F6

Control Module Transmission Range Calculation Performance

Circuit/System Description

This diagnostic applies to internal microprocessor integrity conditions within the hybrid/EV powertrain control module 1. The hybrid/EV powertrain control module 1 is internal to the power inverter module, often referred to as the drive motor generator power inverter module, and is not serviced separately. The hybrid/EV powertrain control module 1 monitors its ability to read and write to the memory. The hybrid/EV powertrain control module 1 processor monitors the data to verify that the commanded range state calculation is correct.

Conditions for Running the DTC

- The vehicle is ON.
- The system voltage is greater than 9.5 V.

Conditions for Setting the DTC

The control module has detected the commanded transmission range state is not correct based upon internal calculations or by a comparison to input or output torque conditions.

Action Taken When the DTC Sets

- DTC P16F6 is a Type A DTC.
- The hybrid/EV powertrain control module 1 requests the hybrid powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTC P16F6 is a Type A DTC.

DTC P179A: AUXILIARY TRANSMISSION FLUID PUMP OVERSPEED

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P179A

Auxiliary Transmission Fluid Pump Overspeed

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains two motor control modules and the hybrid/EV powertrain control module 1. The motor control modules operate their respective drive motor generator based upon drive motor generator power inverter module commands. The hybrid/EV powertrain control module 1 controls the auxiliary transmission fluid pump motor. The hybrid powertrain control module and the motor control modules share the power inverter module ignition voltage circuit, battery voltage circuits and chassis ground.

Conditions for Running the DTC

The vehicle is ON or the power inverter module is awake.

Conditions for Setting the DTC

An auxiliary transmission fluid pump motor speed of greater than 6500 RPM has been detected.

Action Taken When the DTC Sets

DTC P179A is a Type A DTC.

Conditions for Clearing the DTC

DTC P179A is a Type A DTC.

Reference Information

DTC Type Reference

[Powertrain Diagnostic Trouble Code \(DTC\) Type Definitions](#)

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P179A is not set.
 - **If the DTC is set**

1. Verify the T6 Power Inverter Module has the latest calibration in Calibration Information.
 - If the T6 Power Inverter Module does not have the latest calibration, program the T6 power inverter module.
 - If the T6 Power Inverter Module has the latest calibration, replace the T6 Power Inverter Module.
2. Verify the DTC does not set.
 - If the DTC sets, replace the T6 Power Inverter Module.
 - If the DTC does not set.
3. All OK
 - **If the DTC is not set**
3. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Refer to [Control Module References](#) for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup.

DTC P190A-P190F: DRIVE MOTOR 1-2 INVERTER PHASE U, V OR W TEMPERATURE ERRATIC

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P190A

Drive Motor 1 Inverter Phase U Temperature Erratic

DTC P190B

Drive Motor 1 Inverter Phase V Temperature Erratic

DTC P190C

Drive Motor 1 Inverter Phase W Temperature Erratic

DTC P190D

Drive Motor 2 Inverter Phase U Temperature Erratic

DTC P190E

Drive Motor 2 Inverter Phase V Temperature Erratic

DTC P190F

Drive Motor 2 Inverter Phase W Temperature Erratic

Circuit/System Description

This is an internal fault detection of the power inverter module, often referred to as the drive motor generator power inverter module. This fault is handled inside the power inverter module, and no external circuits are involved.

Conditions for Running the DTC

The vehicle is ON.

Conditions for Setting the DTC

The inverter phase temperature is intermittent.

Actions Taken When the DTC Sets

DTCs P190A-P190F are Type B DTCs.

Conditions for Clearing the DTC

DTCs P190A-P190F are Type B DTCs.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Vehicle ON.
2. Verify DTCs P190A-P190F are not set.
 - **If any of the DTCs are set**
 1. Verify the T6 Power Inverter Module has the latest calibration in Calibration Information.
 - If the T6 Power Inverter Module does not have the latest calibration, program the T6 power inverter module.
 - If the T6 Power Inverter Module has the latest calibration, replace the T6 Power Inverter Module.
 2. Verify the DTC does not set.
 - If the DTC sets, replace the T6 Power Inverter Module.
 - If the DTC does not set
 3. All OK.
 - **If none of the DTCs are set**
3. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Refer to Control Module References for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module replacement, programming, and setup

DTC P1A4F, P1A50-P1A54, P1ADC, OR P1ADD: DRIVE MOTOR 1-2 CONTROL MODULE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: Diagnostic System Check - Vehicle

DTC P1A54

Drive Motor 2 Control Module Read Only Memory

DTC P1ADC

Drive Motor 1 Control Module Long Term Memory Performance

DTC P1ADD

Drive Motor 2 Control Module Long Term Memory Performance

Circuit/System Description

The drive motor control modules are internal to the power inverter module, often referred to as the drive motor generator power inverter module, and are not serviced separately. This fault is handled inside the drive motor control modules and no external circuits are involved.

Conditions for Running the DTC

- The vehicle is ON.
- Ignition voltage is 8 - 18 V.

Conditions for Setting the DTC

The control module has detected an internal malfunction or a service module has been installed but not yet programmed.

Actions Taken When the DTC Sets

- DTCs P1A4F, P1A50, P1A51, P1A52, P1A53, and P1A54 are Type A DTCs.
- P1ADC and P1ADD are Type B DTCs.

- The power inverter module requests the hybrid powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

- DTCs P1A4F, P1A50, P1A51, P1A52, P1A53, and P1A54 are Type A DTCs.
- P1ADC and P1ADD are Type B DTCs.

Perform the Diagnostic Repair Verification after completing the repair.

Refer to Control Module References for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup

DTC P1ADE, P1ADF, P1AE0, OR P1AE1: DRIVE MOTOR 1-2 CONTROL MODULE SYSTEM VOLTAGE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: Diagnostic System Check - Vehicle
- Review the description of Strategy Based Diagnosis: Strategy Based Diagnosis
- An overview of each diagnostic category can be found here: Diagnostic Procedure Instructions

DTC Descriptor

DTC P1ADE

Drive Motor 1 Control Module System Voltage Low Voltage

DTC P1ADF

Drive Motor 1 Control Module System Voltage High Voltage

DTC P1AE0

Drive Motor 2 Control Module System Voltage Low Voltage

DTC P1AE1

Drive Motor 2 Control Module System Voltage High Voltage

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains two motor control modules and the hybrid/EV powertrain control module 1. The two motor control modules operate their respective drive motor based upon power inverter module commands. The hybrid/EV powertrain control module 1 controls the auxiliary transmission fluid pump. The hybrid/EV powertrain control module 1 and the motor control modules share the power inverter module ignition voltage circuit, battery voltage circuits and chassis ground.

Conditions for Running the DTC

The Vehicle is ON.

Conditions for Setting the DTC

DTCs P1ADE and P1AE0

Motor control module ignition-voltage is less than or equal to 10 V for 5 s.

DTCs P1ADF and P1AE1

Motor control module ignition voltage is greater than 16 V for 5 s.

Actions Taken When the DTC Sets

DTCs P1ADE, P1ADF, P1AE0 and P1AE1 are Type C DTCs.

Conditions for Clearing the DTC

DTCs P1ADE, P1ADF, P1AE0 and P1AE1 are Type C DTCs.

Diagnostic Aids

A battery charger or vehicle jump start may have set DTCs P1ADF or P1AE1.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P0562 or P0563 is not set.

- **If any of the DTCs are set**

Refer to **DTC B1325, B1330, B1517, C0800, C0899, C0900, C12E1, C12E2, P0561-P0563, P1A0C,**

P1A0D, or P1EFC .

- **If none of the DTCs are set**

3. Verify DTC P1ADE, P1ADF, P1AE0, or P1AE1 is not set.

- **If any of the DTCs are set**

1. Verify the T6 Power Inverter Module has the latest calibration in Calibration Information.

- If the T6 Power Inverter Module does not have the latest calibration, program the T6 power inverter module.
- If the T6 Power Inverter Module has the latest calibration, replace the T6 Power Inverter Module.

2. Verify the DTC does not set.

- If the DTC sets, replace the T6 Power Inverter Module.
- If the DTC does not set.

3. All OK

- **If the DTC is not set**

4. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Refer to [Control Module References](#) for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup.

DTC P1AEE OR P1AEF: DRIVE MOTOR 1-2 CONTROL MODULE HYBRID/EV BATTERY SYSTEM VOLTAGE HIGH VOLTAGE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P1AEE

Drive Motor 1 Control Module Hybrid/EV Battery System Voltage High Voltage

DTC P1AEF

Drive Motor 2 Control Module Hybrid/EV Battery System Voltage High Voltage

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module contains two drive motor control modules. Each motor control module measures hybrid battery high voltage with several internal sensors.

The motor control modules monitors for high voltage that is greater than the system allows during normal operation.

Conditions for Running the DTC

- The hybrid/EV battery system contactor relays are closed.
- Ignition voltage is greater than 8 V and no more than 18 V.

Conditions for Setting the DTC

Greater than 450 V on the high voltage circuit is detected by the motor control module.

OR

The motor control module has detected an internal fault.

Actions Taken When the DTC Sets

- DTCs P1AEE and P1AEF are Type A DTCs.
- The power inverter module disables propulsion during the current ignition cycle.

Conditions for Clearing the DTC

DTCs P1AEE and P1AEF are Type A DTCs.

Diagnostic Aids

If the high voltage contactor relays open while high current is present a large voltage surge may be created. The resultant voltage surge may set DTC P1AEE or P1AEF. Always check for other DTCs or conditions such as loss of isolation, contactor control, etc. that could result in a vehicle shutdown/stall.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P0ABB, P0ABC, or P0ABD is not set.
 - **If any of the DTCs are set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

 - **If none of the DTCs are set**
3. Verify DTC P1AF0, P1AF2, P1AF4, P1AF6, P1B0B, P1B43, P1E1C, or P1E1E is not set.
 - **If any of the DTCs are set**

NOTE: The loss of isolation may be intermittent and internal to the transmission.

Inspect the vehicle for a loss of isolation condition. Refer to [Loss of Isolation on the High Voltage Main Bus](#) .

- **If none of the DTCs are set**
4. Verify no other DTCs are set.
 - **If any DTCs are set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

- **If no other DTCs are set**

5. Verify DTC P1AEE or P1AEF is not set.

- **If any of the DTCs are set**

Replace the T6 Power Inverter Module.

- **If none of the DTCs are set**

6. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Refer to [Control Module References](#) for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup.

DTC P1AF0 OR P1AF2: DRIVE MOTOR 1-2 CONTROL MODULE HYBRID/EV BATTERY VOLTAGE SYSTEM ISOLATION LOST

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P1AF0

Drive Motor 1 Control Module Hybrid/EV Battery Voltage System Isolation Lost

DTC P1AF2

Drive Motor 2 Control Module Hybrid/EV Battery Voltage System Isolation Lost

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains two motor control modules and the hybrid/EV powertrain control module 1. The two motor control modules operate their respective drive motor based upon power inverter module commands. The hybrid/EV powertrain control module 1 controls the auxiliary transmission fluid pump. The motor control modules test for isolation between each high voltage bus and vehicle chassis whenever high voltage is present at the power inverter module.

If the motor control modules detect an isolation loss on either the positive or negative high voltage bus, the hybrid/EV powertrain control module 1 reports a fault. The isolation loss may be caused by any component in the high voltage system.

Conditions for Running the DTC

- DTCs P1AE8, P1AE9, P1AEC, or are not set.
- The high voltage contactor relays are closed.
- High voltage is greater than 50 V.
- Ignition voltage is 8 - 18 V.

Conditions for Setting the DTC

The ratio between Negative Supply Isolation Voltage and Positive Supply Isolation Voltage is greater than 4.53 or less than 0.21 for greater than 2.5 s in a 5 s window.

Actions Taken When the DTC Sets

DTCs P1AF0 and P1AF2 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P1AF0 and P1AF2 are Type B DTCs.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

DTC P1AF4-P1AF7: DRIVE MOTOR 1-2 CONTROL MODULE HYBRID/EV BATTERY VOLTAGE ISOLATION SENSING CIRCUIT 1 LOW/HIGH VOLTAGE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P1AF4

Drive Motor 1 Control Module Hybrid/EV Battery Voltage Isolation Sensing Circuit 1 Low Voltage

DTC P1AF5

Drive Motor 1 Control Module Hybrid/EV Battery Voltage Isolation Sensing Circuit 1 High Voltage

DTC P1AF6

Drive Motor 2 Control Module Hybrid/EV Battery Voltage Isolation Sensing Circuit 1 Low Voltage

DTC P1AF7

Drive Motor 2 Control Module Hybrid/EV Battery Voltage Isolation Sensing Circuit 1 High Voltage

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains two motor control modules and the hybrid/EV powertrain control module 1. Two of the motor control modules operate their respective drive motor based upon power inverter module commands. The hybrid/EV powertrain control module 1 controls the auxiliary transmission fluid pump. The motor control modules and the hybrid/EV powertrain control module 1 are part of the power inverter module and are not serviced separately.

The motor control modules test for isolation between each high voltage bus and vehicle chassis whenever high voltage is present at the power inverter module.

Conditions for Running the DTC

P1AF4 and P1AF6

- The Vehicle is ON.
- The hybrid/EV contactors are closed.

P1AF5 and P1AF7

The Vehicle is ON.

Conditions for Setting the DTC

P1AF4 and P1AF6

The motor control module detects Positive Supply Isolation sensor voltage less than 20 V.

P1AF5 and P1AF7

The motor control module detects the value of the Positive Supply Isolation voltage subtracted from the pack voltage is greater than 60 V.

Actions Taken When the DTC Sets

- DTCs P1AF4, P1AF5, P1AF6 and P1AF7 are Type A DTCs.
- The hybrid/EV powertrain control module 1 requests the hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTCs P1AF4, P1AF5, P1AF6 and P1AF7 are Type A DTCs.

Reference Information

DTC Descriptor

DTC P1B0B

Drive Motor 1 Control Module Hybrid/EV Battery Voltage Isolation Sensing Circuit 2 Low Voltage

DTC P1B0C

Drive Motor 1 Control Module Hybrid/EV Battery Voltage Isolation Sensing Circuit 2 High Voltage

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains two motor control modules and the hybrid/EV powertrain control module 1. The two motor control modules operate their respective drive motor based upon power inverter module commands. The hybrid/EV powertrain control module 1 controls the auxiliary transmission fluid pump. The motor control modules and the hybrid/EV powertrain control module 1 are part of the power inverter module and are not serviced separately.

The motor control modules test for isolation between each high voltage bus and vehicle chassis whenever high voltage is present at the power inverter module.

Conditions for Running the DTC

- The vehicle is ON.
- Contactors are closed.

Conditions for Setting the DTC

P1B0B

The motor control module detects Negative Supply Isolation sensor voltage less than 20 V.

P1B0C

The motor control module detects Negative Supply Isolation sensor voltage greater than 60 V.

Actions Taken When the DTC Sets

- DTCs P1B0B and P1B0C are Type A DTCs.
- The hybrid/EV powertrain control module 1 requests the hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTCs P1B0B and P1B0C are Type A DTCs.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC P1B0D OR P1B0E: DRIVE MOTOR 1-2 CONTROL MODULE DRIVE MOTOR 1-2 OVERSPEED

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC P1B0D

Drive Motor 1 Control Module Drive Motor 1 Overspeed

DTC P1B0E

Drive Motor 2 Control Module Drive Motor 2 Overspeed

Circuit/System Description

The drive motor position sensor is monitored by the drive motor control module. The drive motor control module monitors the angular position, speed and direction of the drive motor based upon the signals of the resolver-type position sensor. The position sensor allows the drive motor control module to determine the exact position, speed and direction of the drive motor. The motor control modules are part of the power inverter module, often referred to as the drive motor generator power inverter module, and are not serviced separately.

Conditions for Running the DTC

Vehicle is ON.

Conditions for Setting the DTC

Drive motor speed is greater than 12,700 RPM.

Actions Taken When the DTC Sets

- DTCs P1B0D and P1B0E are Type A DTCs.
- The hybrid/EV powertrain control module 1 requests the hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTCs P1B0D and P1B0E are Type A DTCs.

Diagnostic Aids

- A transmission mechanical failure that occurs during high drive motor generator torque may cause these DTCs to set.
- Repeated drive motor operation at speeds in excess of the DTC limits may cause deterioration of the drive motor rotor magnets.

Reference Information

DTC P1B15: REGENERATIVE BRAKING TORQUE REQUEST SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P1B15

Regenerative Braking Torque Request Signal Message Counter Incorrect

Circuit/System Description

This diagnostic applies to internal microprocessor integrity conditions within the hybrid/EV powertrain control module 1. The hybrid/EV powertrain control module 1 is internal to the power inverter module, often referred to as the drive motor generator power inverter module, and is not serviced separately. The hybrid/EV powertrain control module 1 monitors its ability to read and write to the memory. The hybrid/EV powertrain control module 1 processor monitors the data to verify that the indicated brake torque request calculation is correct.

Conditions for Running the DTC

- The vehicle is ON for 1 second.
- The Run/Crank system voltage is 9.5 V or greater

OR

The ignition/Run/Crank voltage is 11 V or greater.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

Actions Taken When the DTC Sets

- DTC P1B15 is a Type A DTC.

- The hybrid/EV powertrain control module 1 requests the hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTC P1B15 is a Type A DTC.

- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC P1E0A

Drive Motor 1 Control Module Torque Calculation Performance

DTC P1E0B

Drive Motor 2 Control Module Torque Calculation Performance

Circuit/System Description

The motor control modules perform redundant calculations of desired and achieved torque values. These values are continuously compared and should always be the same.

Conditions for Running the DTC

Ignition voltage is 8 - 18 V.

Conditions for Setting the DTC

The redundant torque calculation does not match the primary calculation.

Action Taken When the DTC Sets

- DTCs P1E0A and P1E0B are Type A DTCs.
- The hybrid/EV powertrain control module 1 requests the hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTCs P1E0A and P1E0B are Type A DTCs.

Reference Information

DTC Type Reference

DTC P1E1B-P1E1F: AUXILIARY TRANSMISSION FLUID PUMP CONTROL MODULE HYBRID/EV

BATTERY VOLTAGE ISOLATION SENSING

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC P1E1B

Auxiliary Transmission Fluid Pump Control Module Hybrid/EV Battery Voltage Isolation Sensing Performance

DTC P1E1C

Auxiliary Transmission Fluid Pump Control Module Hybrid/EV Battery Voltage Isolation Sensing Circuit 1 Low Voltage

DTC P1E1D

Auxiliary Transmission Fluid Pump Control Module Hybrid/EV Battery Voltage Isolation Sensing Circuit 1 High Voltage

DTC P1E1E

Auxiliary Transmission Fluid Pump Control Module Hybrid/EV Battery Voltage Isolation Sensing Circuit 2 Low Voltage

DTC P1E1F

Auxiliary Transmission Fluid Pump Control Module Hybrid/EV Battery Voltage Isolation Sensing Circuit 2 High Voltage

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains three motor control modules and the hybrid/EV powertrain control module 1. Two of the motor control modules operate their respective drive motor based upon power inverter module commands. The third motor control module controls the auxiliary transmission fluid pump. The motor control modules and the hybrid/EV powertrain control module 1 are part of the power inverter module and are not serviced separately.

The motor control modules test for isolation between each high voltage bus and vehicle chassis whenever high voltage is present at the power inverter module.

Conditions for Running the DTC

- The vehicle is ON.
- The system voltage is at least 9 V.

Conditions for Setting the DTC

P1E1B

The motor control module detects a correlation difference between the Isolation Supply sensor and overall pack

voltage.

P1E1C and P1E1E

The motor control module detects Isolation Supply sensor voltage less than 20 V.

P1E1D and P1E1F

The motor control module detects Isolation Supply sensor voltage greater than 40 V.

Action Taken When the DTC Sets

DTCs P1E1B, P1E15C, P1E1D, P1E1E, and P1E1F are Type B DTCs.

Conditions for Clearing the DTC

DTCs P1E1B, P1E15C, P1E1D, P1E1E, and P1E1F are Type B DTCs.

DTC Descriptors

DTC P1E22

Auxiliary Transmission Fluid Pump Control Module Hybrid/EV Battery Voltage System Isolation Lost

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains three motor control modules and the hybrid/EV powertrain control module 1. Two of the motor control modules operate their respective drive motor based upon power inverter module commands. The third motor control module controls the auxiliary transmission fluid pump. Each drive motor control module monitors its internal high voltage sensor for correct operation; no external circuits are involved. The motor control modules and the hybrid/EV powertrain control module 1 are part of the power inverter module and are not serviced separately.

The motor control modules test for isolation between each high voltage bus and vehicle chassis whenever high voltage is present at the power inverter module.

Conditions for Running the DTC

- The vehicle is ON.
- The system voltage is 8 - 18 V.
- The high voltage contactor relays are closed.
- DTCs P1AE8, P1AE9, or P1AEC are not set.

Conditions for Setting the DTC

The drive motor control module detects an isolation fault between the battery pack and chassis ground.

Action Taken When the DTC Sets

DTC P1E22 is a Type B DTC.

Conditions for Clearing the DTC

DTC P1E22 is a Type B DTC.

DTC P1E2A

Auxiliary Transmission Fluid Pump Phase U Current Sensor Circuit Low Voltage

DTC P1E2B

Auxiliary Transmission Fluid Pump Phase U Current Sensor Circuit High Voltage

DTC P1E2C

Auxiliary Transmission Fluid Pump Phase U Current Sensor Performance

DTC P1E2D

Auxiliary Transmission Fluid Pump Phase V Current Sensor Circuit Low Voltage

DTC P1E2E

Auxiliary Transmission Fluid Pump Phase V Current Sensor Circuit High Voltage

DTC P1E2F

Auxiliary Transmission Fluid Pump Phase V Current Sensor Performance

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains two motor control modules and the hybrid/EV powertrain control module 1. The two motor control modules operate their respective drive motor generator based upon power inverter module commands. The hybrid/EV powertrain control module 1 controls the auxiliary transmission fluid pump. This is an internal fault detection of the power inverter module. This fault is handled inside the power inverter module and no external circuits are involved.

Each motor control module operates its respective drive motor based upon hybrid/EV powertrain control module 1 commands. Each motor control module controls its respective motor through the sequencing actuation of high current switching transistors called insulated gate bipolar transistors. Each motor operates utilizing 3-phase alternating current AC electricity. Each insulated gate bipolar transistor operates a single phase of the drive motor generator. Each phase is individually identified as U, V, and W. Each motor control module monitors the current of each phase in order to detect out of range current conditions.

Because each individual motor's phase circuits are electrically joined together, the phases normally flow about the same amount of current. The motor control module performs a mathematical calculation to verify that the phase current sensors are accurate. If the U-V-W phase current sensors indicate about the same amount of phase current, the sum of the calculation should be near zero. If the U-V-W phase currents are not similar, this DTC will set.

Conditions for Running the DTC

The vehicle is ON or the module is awake.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

Actions Taken When the DTC Sets

- DTCs P1E2A, P1E2B, P1E2C, P1E2D, P1E2E, P1E2F, are Type A DTCs.
- The power inverter module requests the hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTCs P1E2A, P1E2B, P1E2C, P1E2D, P1E2E, P1E2F, are Type A DTCs.

DTC P1E34-P1E36: AUXILIARY TRANSMISSION FLUID PUMP INVERTER TEMPERATURE SENSOR

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P1E34

Auxiliary Transmission Fluid Pump Inverter Temperature Sensor Circuit High Voltage

DTC P1E35

Auxiliary Transmission Fluid Pump Inverter Temperature Sensor Circuit Low Voltage

DTC P1E36

Auxiliary Transmission Fluid Pump Inverter Temperature Sensor Performance

Circuit/System Description

This is an internal fault detection of the power inverter module, often referred to as the drive motor generator power inverter module. This fault is handled inside the power inverter module, and no external circuits are involved.

Conditions for Running the DTC

- The vehicle is ON or the module is awake.
- Motor temperature is greater than -20°C (-4°F). If motor temperature is less than -20°C (-4°F) at vehicle ON, the drive motor must operate at greater than 20 N.m (14.75 lb ft) for a cumulative time of 1.5 minutes before the DTC will run.

P1E34

- The vehicle is ON or the module is awake for more than 10 minutes.

- The drive motor(s) have been operating.

P1E35

The vehicle is ON or the module is awake.

P1E36

- The inverter temperature is greater than -20°C (-4°F).
- P0AF0 and P0AEF are not present.

Conditions for Setting the DTC

P1E34

The inverter phase temperature sensor is less than -50°C (-58°F) for 3 seconds. If the fault is detected at the start of a drive cycle the DTC will set after 600 s.

P1E35

The inverter phase temperature sensor is greater than 170°C (338°F) for 3 s.

P1E36

A 20°C (36°F) difference is observed between the individual inverter phase temperature sensor and the average of the Hybrid Electronics Coolant Temperature and the Transmission Fluid Temperature.

Actions Taken When the DTC Sets

DTCs P1E34, P1E35, and P1E36 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P1E34, P1E35, and P1E36 are Type B DTCs.

Reference Information

DTC P1E37: AUXILIARY TRANSMISSION FLUID PUMP INVERTER HIGH TEMPERATURE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P1E37

Auxiliary Transmission Fluid Pump Inverter High Temperature

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains two motor control modules and the hybrid/EV powertrain control module 1. The two motor control modules operate their respective drive motor based upon power inverter module commands. The hybrid/EV powertrain control module 1 controls the auxiliary transmission fluid pump. The inverter temperature sensor is part of the power inverter module and is not serviced separately.

Conditions for Setting the DTC

The pump inverter temperature sensor is greater than 122Â°C (252Â°F).

Actions Taken When the DTC Sets

- DTC P1E37 is a Type A DTC.
- The hybrid/EV powertrain control module 1 may command the engine into derate mode.

Conditions for Clearing the DTC

DTC P1E37 is a Type A DTC.

Diagnostic Aids

- Ask about the customer's driving habits, trailer towing, etc.
- Ensure the engine cooling system is functioning normally.

 4. All OK
 - **If the DTC is not set**
5. All OK

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Refer to Control Module References for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup.

DTC P1E38: AUXILIARY TRANSMISSION FLUID PUMP INVERTER SUPPLY VOLTAGE CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: Diagnostic System Check - Vehicle

- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P1E38

Auxiliary Transmission Fluid Pump Inverter Supply Voltage Circuit

Circuit/System Description

The power inverter motor, often referred to as the drive motor generator power inverter module, contains two motor control modules and the hybrid/EV powertrain control module 1. The two motor control modules operate their respective drive motor based upon power inverter module commands. The hybrid/EV powertrain control module 1 controls the auxiliary transmission fluid pump. The hybrid/EV powertrain control module 1 and the motor control modules share the power inverter module ignition voltage circuit, battery voltage circuits and chassis ground.

Conditions for Running the DTC

Vehicle is ON or module is awake.

Conditions for Setting the DTC

The control module does not detect voltage at the insulated gate bi-polar transistor bias power supply.

Actions Taken When the DTC Sets

- DTC P1E38 is a Type A DTC.
- Propulsion is disabled.

Conditions for Clearing the DTC

DTC P1E38 is a Type A DTC.

Diagnostic Aids

To assist in troubleshooting and duplicating intermittent failure conditions, observe the Freeze Frame/Failure Records data. This is especially important to do before programming or replacing the power inverter module.

Circuit/System Verification

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Perform the **High Voltage Disabling** procedure for servicing the T6 Power Inverter Module or the T12 Transmission.
2. Disconnect the X4 harness connector at the T6 Power Inverter Module.
3. Test for infinite resistance between the each of the AC circuit terminals listed below and ground for each phase of the G5 Transmission Fluid Pump - Electric/Auxiliary:
 - X4 terminal 3 phase U
 - X4 terminal 2 phase V
 - X4 terminal 1 phase W
 - **If less than infinite resistance**

Replace the G5 Transmission Fluid Pump - Electric/Auxiliary.

- **If infinite resistance**

4. Verify DTC P1E38 does not set.

- **If the DTC sets**

1. Perform each of the operations listed below one at a time until the fault is corrected.

1. Verify the T6 Power Inverter Module has the latest calibration in Calibration Information.

- If the T6 Power Inverter Module does not have the latest calibration, program the T6 power inverter module.
- If the T6 Power Inverter Module has the latest calibration

2. Replace the T6 Power Inverter Module.

3. Replace the G5 Transmission Fluid Pump - Electric/Auxiliary.

2. Repeat the DTC check.

- **If the DTC does not set**

5. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to [Automatic Transmission Fluid Pump and Fluid Filter Removal](#) for G5 Transmission Fluid Pump - Electric/Auxiliary, often referred to as the A/Trans Fluid Pump Motor, replacement
- Refer to [Control Module References](#) for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup

DTC P1E39: AUXILIARY TRANSMISSION FLUID PUMP INVERTER PERFORMANCE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P1E39

Auxiliary Transmission Fluid Pump Inverter Performance

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains two motor control modules and the hybrid/EV powertrain control module 1. The two motor control modules operate their respective drive motor based upon power inverter module commands. The hybrid/EV powertrain control module 1 controls the auxiliary transmission fluid pump. Each motor control module controls its respective motor through the sequencing actuation of high current switching transistors called insulated gate bipolar transistors. Each insulated gate bipolar transistor assembly is monitored for fault conditions. The motor control modules are part of the power inverter module and are not serviced separately.

Conditions for Running the DTC

Vehicle is ON or Charge Mode is active.

Conditions for Setting the DTC

The motor control module detects excessive current flow through the switched portion of the insulated gate bipolar transistor.

Actions Taken When the DTC Sets

- DTC P1E39 is a Type A DTC.
- Propulsion is disabled.

Conditions for Clearing the DTC

DTC P1E39 is a Type A DTC.

Diagnostic Aids

To assist in troubleshooting and duplicating intermittent failure conditions, observe the Freeze Frame/Failure Records data. This is especially important to do before programming or replacing the power inverter module.

- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P1E3A

Auxiliary Transmission Fluid Pump Motor Torque Delivered Performance

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains two motor control modules and the hybrid/EV powertrain control module 1. The two motor control modules operate their respective drive motor based upon power inverter module commands. The hybrid/EV powertrain control module 1 controls the auxiliary transmission fluid pump. The hybrid/EV powertrain control module 1 and the motor control modules share the power inverter module ignition voltage circuit, battery voltage circuits and chassis ground.

Conditions for Running the DTC

- The vehicle is ON.
- The system voltage is between 11.0 - 16.0 V.
- Auxiliary transmission fluid pump torque command is greater than 6.5 N.m (4.8 lb ft).

Conditions for Setting the DTC

The actual auxiliary transmission fluid pump speed is more than 200 RPM different from the commanded speed.

Actions Taken When the DTC Sets

DTC P1E3A is a Type A DTC.

Conditions for Clearing the DTC

DTC P1E3A is a Type A DTC.

Diagnostic Aids

There should always be other hybrid/EV powertrain or motor control module DTCs set along with DTC P1E3A. Always diagnose other DTCs before addressing this DTC.

 1. Replace the G5 Automatic Transmission Fluid Pump.
 2. Verify the DTC does not set.
 - If the DTC sets, replace the T6 Power Inverter Module.
 - If the DTC does not set
 3. All OK
 - If the DTC is not set.
 - 3. All OK
 - **If the DTC is not set**
3. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Automatic Transmission Fluid Pump and Fluid Filter Removal](#) for G5 Automatic Transmission Fluid Pump, often referred to as the A/Trans Fluid Pump Motor, replacement

- Refer to [Control Module References](#) for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup

DTC P1E4A OR P1E4B: CONTROL MODULE REDUNDANT DRIVE MOTOR 1-2 SPEED SENSING CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P1E4A

Control Module Redundant Drive Motor 1 Speed Sensing Circuit

DTC P1E4B

Control Module Redundant Drive Motor 2 Speed Sensing Circuit

Circuit/System Description

The drive motor position sensor is monitored by the motor control module. The motor control module monitors the angular position, speed and direction of the drive motor based upon the signals of the resolver-type position sensor. The position sensor allows the motor control module to determine the exact position, speed and direction of the drive motor. The hybrid/EV powertrain control module 1 also calculates motor speed. This fault is handled inside the power inverter module, often referred to as the drive motor generator power inverter module, and no external circuits are involved.

Conditions for Running the DTC

- This diagnostic runs one time at vehicle ON.
- System voltage is greater than 11 V.
- No serial data communication faults.

Conditions for Setting the DTC

The calculated motor speed is greater than 400 RPM different from the measured speed for 3 s within a 5 s window.

Actions Taken When the DTC Sets

- DTC P1E4A is a Type A DTC.
- DTC P1E4B is a Type A DTC.
- Propulsion will be disabled.

Conditions for Clearing the DTC

- DTC P1E4A is a Type A DTC.
- DTC P1E4B is a Type A DTC.

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P0562 or P0563 is not set.
 - **If any of the DTCs are set**

Refer to **DTC B1325, B1330, B1517, C0800, C0899, C0900, C12E1, C12E2, P0561-P0563, P1A0C, P1A0D, or P1EFC** .
 - **If none of the DTCs are set**
3. Verify DTC P1E4A or P1E4B is not set.
 - **If any of the DTCs are set**
 1. Verify the T6 Power Inverter Module has the latest calibration in Calibration Information.
 - If the T6 Power Inverter Module does not have the latest calibration, program the T6 power inverter module.
 - If the T6 Power Inverter Module has the latest calibration, replace the T6 Power Inverter Module.
 2. Verify the DTC does not set.
 - If the DTC sets, replace the T6 Power Inverter Module.
 - If the DTC does not set.
 - **If none of the DTCs are set**
4. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup.

DTC P1F00: AUXILIARY TRANSMISSION FLUID PUMP INVERTER TEMPERATURE SENSOR CIRCUIT ERRATIC

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC P1F00

Auxiliary Transmission Fluid Pump Inverter Temperature Sensor Circuit Erratic

Circuit/System Description

This is an internal fault detection of the power inverter module, often referred to as the drive motor generator power inverter module. This fault is handled inside the power inverter module, and no external circuits are involved.

Conditions for Running the DTC

- The vehicle is ON or the module is awake.
- The module has been awake for more than 10 minutes.

Conditions for Setting the DTC

The inverter phase temperature sensor signal is intermittent.

Actions Taken When the DTC Sets

DTC P1F00 is a Type B DTC.

Conditions for Clearing the DTC

DTC P1F00 is a Type B DTC.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P1F00 is not set.
 - **If the DTC is set**
 1. Verify the T6 Power Inverter Module has the latest calibration in Calibration Information.
 - If the T6 Power Inverter Module does not have the latest calibration, program the T6 power inverter module.
 - If the T6 Power Inverter Module has the latest calibration, replace the T6 Power Inverter Module.
 2. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
 3. Verify the DTC does not set.
 - If the DTC sets, replace the T6 Power Inverter Module.
 - If the DTC does not set
 4. All OK.
 - **If the DTC is not set**
3. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Refer to Control Module References for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup.

DTC P1F63-P1F65: HYBRID/EV SYSTEM VOLTAGE DISCHARGE CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P1F63

Hybrid/EV System Voltage Discharge Circuit Performance

DTC P1F64

Hybrid/EV System Voltage Discharge Circuit Low Voltage

DTC P1F65

Hybrid/EV System Voltage Discharge Circuit High Voltage

Circuit/System Description

This is an internal fault detection of the power inverter module, often referred to as the drive motor generator power inverter module. This fault is handled inside the power inverter module, and no external circuits are involved.

Conditions for Running the DTC

P1F63

- High voltage as measured by the power inverter module prior to commanding discharge is greater than 330 V.
- The high voltage main contactors are commanded OPEN.
- High voltage as measured by the power inverter module after discharge completes is less than 200 V.
- Drive motor speeds are less than 200 RPM.

P1F64 or P1F65

The vehicle is ON or the module is awake.

Conditions for Setting the DTC

DTC P1F63

The high voltage as measured by the power inverter module does not decrease by 20 V or greater within 0.1 seconds of commanding the discharge circuit ON.

DTC P1F64

The module internal diagnostic circuit detects the discharge resistor circuit is OPEN.

DTC P1F65

The module internal diagnostic circuit detects the discharge resistor circuit is shorted.

Actions Taken When the DTC Sets

DTCs P1F63, P1F64, and P1F65 are Type A DTCs.

Conditions for Clearing the DTC

DTCs P1F63, P1F64, and P1F65 are Type A DTCs.

Diagnostic Aids

Low 12 V system voltage may cause one or more of these DTCs to set.

2. Verify DTC B1325, B1330, B1517, C0800, C0899, C0900, C12E1, C12E2, P0561-P0563, P1A0C, P1A0D, or P1EFC is not set.

- **If any of the DTCs are set**

Refer to **DTC B1325, B1330, B1517, C0800, C0899, C0900, C12E1, C12E2, P0561-P0563, P1A0C, P1A0D, or P1EFC** .

- **If none of the DTCs are set**

3. Verify DTC P1F63, P1F64, or P1F65 is not set.

- **If any of the DTCs are set**

1. Verify the T6 Power Inverter Module has the latest calibration in Calibration Information.
 - If the T6 Power Inverter Module does not have the latest calibration, program the T6 power inverter module.
 - If the T6 Power Inverter Module has the latest calibration, replace the T6 Power Inverter Module.
2. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
3. Verify the DTC does not set.
 - If the DTC sets, replace the T6 Power Inverter Module.
 - If the DTC does not set

4. All OK.

- **If none of the DTCs are set**

4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup.

DTC P2797: AUXILIARY TRANSMISSION FLUID PUMP PERFORMANCE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P2797

Auxiliary Transmission Fluid Pump Performance

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains three motor control modules and the hybrid/EV powertrain control module 1. Two of the motor control modules operate their respective drive motor based upon power inverter module commands. The third motor control module controls the auxiliary transmission fluid pump. The hybrid/EV powertrain control module 1 and the motor control modules share the power inverter module ignition voltage circuit, battery voltage circuits and chassis ground.

Conditions for Running the DTC

- The vehicle is ON.
- The system voltage is greater than 9 V.
- Auxiliary transmission fluid pump speed is greater than 5 RPM.

Conditions for Setting the DTC

The actual auxiliary transmission fluid pump speed is not within a calibrated threshold of the commanded speed.

Action Taken When the DTC Sets

- DTC P2797 is a Type A DTC.
- The power inverter module requests the hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTC P2797 is a Type A DTC.

Diagnostic Aids

- Usually, other hybrid/EV powertrain or motor control module DTCs set along with DTC P2797. Always diagnose other DTCs before addressing this DTC.
- This DTC may set if the vehicle is run out of fuel while driving.
- This DTC may be set if the high voltage contactors open while the Auxiliary Transmission Fluid Pump has been commanded on using the Scan Tool.
- This DTC may be set if the transmission fluid gets too hot. Causes of transmission overheating include transmission fluid level that is either too low or too high.

Reference Information

DTC Type Reference

[Powertrain Diagnostic Trouble Code \(DTC\) Type Definitions](#)

Circuit/System Verification

1. Verify that no other hybrid/EV powertrain or motor control module DTC is set.

- **If any of the DTCs are set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

- **If none of the DTCs are set**

NOTE: Fluid level that is either too high or too low can result in overheating.

2. Verify the transmission fluid level and condition is correct and inspect for other causes of transmission overheating. Refer to [Transmission Fluid Level and Condition Check](#) , and [Transmission Overheats](#) .

- **If a condition was found**

Repair as necessary.

- **If a condition was not found**

3. Verify DTC P2797 is not set.

- **If the DTC is set**

1. Verify the T6 Power Inverter Module has the latest calibration in Calibration Information.

- If the T6 Power Inverter Module does not have the latest calibration, program the T6 power inverter module.
- If the T6 Power Inverter Module has the latest calibration, replace the T6 Power Inverter Module.

2. Verify the DTC does not set.

- If the DTC sets.

1. Replace the G5 Transmission Fluid Pump - Electric/Auxiliary.

2. Verify the DTC does not set.

- If the DTC sets, replace the T6 Power Inverter Module.

- **If the DTC is not set**

4. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Automatic Transmission Fluid Pump and Fluid Filter Removal](#) G5 Transmission Fluid Pump - Electric/Auxiliary, often referred to as the A/Trans Aux Fluid Pump Motor, replacement
- Refer to [Control Module References](#) for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup

DTC P3260: INTERNAL CONTROL MODULE DRIVE MOTOR CONTROL PERFORMANCE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P3260

Internal Control Module Drive Motor Control Performance

Circuit/System Description

The hybrid/EV powertrain control module 1 monitors for the engine speed and drive motor torque to go below calibrated limits when the transmission is shifted into Neutral. The hybrid/EV powertrain control module 1 is part of the drive motor generator power inverter module and is not serviced separately.

Conditions for Running the DTC

- Automatic transmission manual shift shaft is in Neutral.
- No Vehicle Speed DTCs or P1824, P182A-P182F, P1838-P1841, P18B5-P18BA, P18BC, P18BF, P18C0, P18C2, or P18C3 internal mode switch DTCs are set.
- Vehicle speed is less than 3 MPH (5 km/h).

Conditions for Setting the DTC

NOTE: There is a running calibration change for model year and a service release for model year 2016. Re-program the controller first and then check the following conditions.

Either of the following conditions is detected 33 seconds after the Conditions for Running the DTC have been met:

- Drive Motor A torque is greater than 4.
- OR
- Engine speed is greater than 200 RPM.

Action Taken When the DTC Sets

DTC P3260 is a Type A DTC.

Conditions for Clearing the DTC

DTC P3260 is a Type A DTC.

Circuit/System Verification

1. Verify DTCs that inhibit Autostop operation, or stuck clutch DTCs P07A3 or P07A5, or pressure controls solenoid DTCs P0960, P0962, or P0963 are not set.

- **If any of the DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If none of the DTCs are set**

2. Verify DTC P3260 is not set.

- **If the DTC is set**

1. Verify the T6 Power Inverter Module has the latest calibration in Calibration Information.

- If the T6 Power Inverter Module does not have the latest calibration, program the T6 power inverter module.
- If the T6 Power Inverter Module has the latest calibration, replace the T6 Power Inverter Module.

NOTE: **The transmission must be in Neutral for greater than 33 seconds.**

2. Vehicle ON, verify the DTC does not set.

- If the DTC sets, replace the T6 Power Inverter Module.
- If the DTC is not set

3. All OK.

- **If the DTC is not set**

3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Refer to **Control Module References** for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming and setup

SYMPTOMS - HYBRID CONTROLS

NOTE: **The following steps must be completed before using the symptom tables.**

1. Perform the **Diagnostic System Check - Vehicle** before using the symptom tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions.

Refer to the following procedures:

- **Drive Motor Power Inverter Module Description and Operation**

- [High Voltage Monitoring Systems Description](#)
- [Hybrid Modes of Operation Description](#)
- [Drive Motor Battery System Description](#)
- [Transmission General Description](#)

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Hybrid System. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [DC Power Conversion Test](#)
- [Drive Mode Select Switch Malfunction](#)

DRIVE MODE SELECT SWITCH MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	Stuck in Normal Mode	Stuck in Normal Mode	-	P1762
Ground	-	Stuck in Normal Mode	-	P1762

Circuit/System Description

The body control module (BCM) monitors the state of the drive mode select switch. The BCM sends the drive mode select switch signal message to the ECM over the serial data circuits. The ECM uses this message to determine the following driver selected mode of operation:

- Normal
- Sport
- Mountain
- Hold, some models

Diagnostic Aids

- Under normal operation, when the DRIVE MODE button is pressed, the drive mode select switch closes and the scan tool BCM Drive Mode Select Switch parameter displays Active. When the DRIVE MODE button is released, the switch opens, the parameter displays Inactive, and the driver information center display is updated.
- When attempting to run or set ECM serial data DTCs, run the vehicle in propulsion system active mode for at least 1 minute, and then shut the vehicle off for 30 seconds. Following this procedure will allow for a complete ECM shutdown.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Run the vehicle in propulsion system active mode for 1 minute, then vehicle OFF for 30 seconds.
2. Verify the scan tool BCM Drive Mode Select Switch parameter displays Inactive when DRIVE MODE button is not pressed and Active when pressed and held.

- **If the BCM Drive Mode Select Switch parameter does not indicate the correct status**

Refer to Circuit/System Testing.

- **If the BCM Drive Mode Select Switch parameter indicates the correct status**

3. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S126 Drive Mode Select Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 4 and ground
 - **If 10 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**

3. Vehicle ON.
4. Verify the scan tool BCM Drive Mode Select Switch parameter displays Inactive.
 - **If the parameter does not display Inactive**
 1. Vehicle OFF, disconnect the X6 harness connector at the K9 BCM.
 2. Test for infinite resistance between the signal circuit terminal 22 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 BCM.
 - **If the parameter displays Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the ground circuit terminal 4.
6. Verify the scan tool BCM Drive Mode Select Switch parameter displays Active.
 - **If the parameter does not display Active**
 1. Vehicle OFF, remove the jumper wire, disconnect the X6 harness connector at the K9 BCM.
 2. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 BCM.
 - **If the parameter displays Active**
7. Test or replace the S126 Drive Mode Select Switch.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the S126 Drive Mode Select Switch.
2. Test for infinite resistance between the signal terminal 1 and the ground terminal 4 with the switch in the open position.
 - **If less than infinite resistance**

Replace the S126 Drive Mode Select Switch.
 - **If infinite resistance**
3. Test for less than 2 Ω between the signal terminal 1 and the ground terminal 4 with the switch in the closed position.
 - **If 2 Ω or greater**

Replace the S126 Drive Mode Select Switch.
 - **If less than 2 Ω**
4. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Control Module References](#) for K9 Body Control Module replacement, programming, and setup
- Refer to [Radio Control Assembly Replacement](#) for S126 Drive Mode Select Switch replacement

DC POWER CONVERSION TEST

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)

- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

Circuit/System Description

The 14 V power module, often referred to as the accessory DC power control module, supplies the energy that flows between the high voltage (360 V) direct current (DC) and low voltage (14 V) DC to charge the 12 V battery and to operate the power accessories. The ECM controls the 14 V power module by supplying 5 V pulse width modulated (PWM) signal through a control circuit. The 14 V power module sends 5 V PWM feedback signal to the ECM through the feedback circuit. The 14 V power module generates more power as the commanded duty cycle increases.

Diagnostic Aids

Using a carbon pile tester is the preferred method to test the 14 V power module. The carbon pile tester can put an increasing load on the system to reach a target current level. If a carbon pile tester is not available, the alternative method is using the scan tool 14 V power module setpoint.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Vehicle OFF.
2. Measure and record the C1 battery voltage at the C1 battery terminals. The C1 battery voltage should stabilize between 12.4 and 12.8 V within a few minutes of turning the vehicle OFF.
 - **If not within the specified range**
 Refer to [Battery Inspection/Test](#) .
 - **If within the specified range**
3. Vehicle ON, accessories OFF.
4. Measure and record the C1 battery voltage at the C1 battery terminals. The voltage should be at least 1 V greater than the voltage measured in step 1 but less than 15.6 V.
 - **If not within the specified range**

Refer to Circuit/System Testing.

- **If within the specified range**

5. All OK.

Circuit/System Testing

NOTE: If a carbon pile tester is available, refer to With Carbon Pile Tester section. Otherwise, refer to Without Carbon Pile Tester section.

With Carbon Pile Tester

1. Vehicle ON.
2. Verify that no K1 14 V Power Module or B18 Battery Current Sensor DTCs are set that would cause a charging system concern.

- **If an applicable DTC is set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

- **If no applicable DTCs are set**

3. Vehicle OFF.
4. Test for 12.4 V or greater at room temperature across the C1 Battery terminals.

- **If not within the specified range**

Refer to [Battery Inspection/Test](#) .

- **If within the specified range**

5. Connect a carbon pile tester to the C1 Battery.
6. Vehicle ON, turn all accessories off. Observe the voltage reading on the tester. The voltage should read between 12.6 - 15.5 V.
7. Adjust the carbon pile tester so that the Low - Voltage Battery Current parameter on the 14 V Power Module data list of the Engine Control Module is reading 160 amps.
8. Verify the voltage reading remains between 12.6 - 15.5 V.

- **If not within the specified range**

Replace the K1 14 V Power Module.

- **If within the specified range**

9. All OK.

Without Carbon Pile Tester

1. Vehicle ON.
2. Verify that no K1 14 V Power Module or B18 Battery Current Sensor DTCs are set that would cause a charging system concern.

- **If an applicable DTC is set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

- **If no applicable DTCs are set**

3. Vehicle OFF.

4. Test for 12.4 V or greater at room temperature across the C1 Battery terminals.

- **If not within the specified range**

Refer to [Battery Inspection/Test](#) .

- **If within the specified range**

5. Vehicle ON.

6. Verify the scan tool Engine Control Module Ignition 1 Signal parameter continually increases when controlling the Engine Control Module 14 V Power Module Setpoint from 10 - 80% with a scan tool. It may take up to 10 s for the battery voltage to stabilize between each setpoint change.

- **If the battery voltage does not continually increase**

Replace the K1 14 V Power Module.

- **If the battery voltage continually increases**

7. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Refer to [Control Module References](#) for K1 14 V Power Module, often referred to as the Accessory DC Power Control Module, replacement, programming, and setup

ACCESSORY DC POWER CONTROL MODULE REPLACEMENT

Special Tools

BO-38185 Hose Clamp Pliers

Equivalent regional tools: [Special Tools](#)

Removal Procedure

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Disable high voltage system. Refer to [High Voltage Disabling](#)
2. Remove Rear Compartment Floor Stowage Trim Compartment. Refer to [Rear Compartment Floor Stowage Trim Compartment Replacement](#)

3. Disconnect Battery Negative Cable. Refer to [Battery Negative Cable Disconnection and Connection](#)
4. Drain the cooling system. Refer to [Drive Motor Generator Power Inverter Module Cooling System Draining and Filling](#)

CAUTION: Ensure the cooling system is drained, and hoses are removed prior to disconnecting any electrical connections. Failure to do this may result in damage to the electrical connectors or components. Any damaged electrical connectors or components must be replaced.

Fig. 6: Accessory DC Power Control Module, Bolt, Nuts, Coolant Hoses, Clamps And Electrical Connectors

Courtesy of GENERAL MOTORS COMPANY

5. Loosen Clamps (3, 5) (Qty: 2) using **BO-38185** pliers
6. Remove Coolant Hoses (Qty: 2)
7. Disconnect Electrical Connectors (2, 4)
8. Remove the battery positive and negative cable nut (APM ground cable) (6).
9. Remove the battery positive and negative cable nut (B+ APM Module to Battery Fuse Block) (7).
10. Remove 2 the accessory dc power control module nuts (1).
11. Remove the accessory dc power control module bolt (8).
12. Remove the accessory dc power control module (9).

Installation Procedure

CAUTION: Ensure that all electrical connections are made before the hoses are connected, and the cooling system is filled. Failure to do this may result in damage to the electrical connectors or components. Any damaged electrical connectors or components must be replaced.

Fig. 7: Accessory DC Power Control Module, Bolt, Nuts, Coolant Hoses, Clamps And Electrical Connectors

Courtesy of GENERAL MOTORS COMPANY

1. Install the accessory dc power control module (9).

CAUTION: Refer to [Fastener Caution](#)

2. Install the accessory dc power control module bolt (8) and tighten to 22 N.m (16 lb ft).
3. Install 2 the accessory dc power control module nuts (1) and tighten to 22 N.m (16 lb ft).
4. Install the battery positive and negative cable nuts (B+ APM Module to Battery Fuse Block) (7) and tighten to 22 N.m (16 lb ft).
5. Install the battery positive and negative cable nut (APM ground cable) (6) and tighten to 22 N.m (16 lb ft).
6. Connect Electrical Connectors (2, 4)
7. Install Coolant Hoses (Qty: 2)
8. Install Clamps (3, 5) (Qty: 2) using **BO-38185** pliers
9. Fill the cooling system. Refer to [Drive Motor Generator Power Inverter Module Cooling System Draining and Filling](#)
10. Connect Battery Negative Cable. Refer to [Battery Negative Cable Disconnection and Connection](#)
11. Install Rear Compartment Floor Stowage Trim Compartment. Refer to [Rear Compartment Floor Stowage Trim Compartment Replacement](#)
12. Enable high voltage system. Refer to [High Voltage Enabling](#)

DESCRIPTION AND OPERATION

ACCESSORY DC POWER CONTROL MODULE DESCRIPTION AND OPERATION

Location

The 14 V power module, also called the accessory DC power control module, is located in the rear trunk compartment underneath the floor stowage trim panel. It is attached to the chassis with four fasteners. The 14 V power module is cooled with pre-mixed Dexcool® circulating through a cooling system that is separate from the engine cooling system.

The 14 V power module is an electronic device that takes the place of the generator on a traditional vehicle. On a

hybrid or electric vehicle the 14 V power module converts high voltage (300 V) direct current (DC) to low voltage (12 V) DC for accessory electrical operation and to charge the 12 V battery.

Normally, the 14 V power module only supplies 12 V DC when the vehicle is under a normal drive cycle. However there are certain instances when the vehicle is being charged through a standard wall socket where the 14 V power module operation is required to sustain the 12 V battery.

The 14 V power module is capable of supplying up to 130 Amps of 12 V DC.

Communication and Hosted Diagnostics

The 14 V power module has no internal diagnostic tests and does not communicate over serial data. The engine control module (ECM) monitors and controls the 14 V power module and will report DTCs if a fault is detected.

Circuit Inputs

Inputs to the 14 V power module include the high voltage and 12 V circuits. The 14 V power module also has a pulse width modulated set point input from the engine control module (ECM). This input enables conversion of voltage from high to the desired 12 V output level.

For more information on the 12 V Battery Charging System, refer to [**Charging System Description and Operation**](#).

Circuit Outputs

Outputs

The only outputs supported by the 14 V power module are the status feedback circuit to the engine control module (ECM) and 12 V DC which powers the 12 V components in the vehicle and charges the 12 V battery.

Low voltage 12 V cables on the hybrid/EV vehicle do not require unique coloring or servicing procedures.

DRIVE MOTOR POWER INVERTER MODULE DESCRIPTION AND OPERATION

Overview

The power inverter module, often referred to as the drive motor generator power inverter module, converts high voltage direct current (DC) electrical energy to 3-phase alternating current (AC) electrical energy. It is mounted directly to the transmission and is cooled with pre-mixed DEX-COOLÂ® circulating through a cooling system that is separate from the engine cooling system. The hybrid cooling system utilizes a heat exchanger at the front of the vehicle and electric pumps to circulate the coolant. Refer to [**Hybrid/EV Cooling System Description and Operation**](#).

High Voltage Circuits

Direct Current (DC)

The power inverter module is connected to the positive and negative terminals of the high voltage DC hybrid/EV battery pack. Both of the negative and positive high voltage DC battery poles are electrically isolated from the vehicle chassis by a specific amount of resistance. Each high voltage DC bus is switched ON or OFF by a high voltage, high current contactor relay contained within the hybrid/EV battery pack. All high voltage DC negative and positive DC cables are individually shielded and orange in color to alert the technician to the potential presence of high voltage.

Three Phase Alternating Current (AC)

There two 3-phase motors in the transmission, connected directly to the power inverter module via ring terminals and

A/C connector rods. A single shielded cable connects the auxiliary transmission fluid pump to the power inverter module. This cable contains 3 individual wires that are connected to the 3 phases of the auxiliary transmission fluid pump. The cable is orange in color to alert the technician to the potential presence of high voltage.

Drive Motor Generator Power Inverter Module

Overview

The power inverter module contains 2 motor control modules and the hybrid/EV powertrain control module 1. Two of the motor control modules operate their respective drive motors based upon power inverter module commands. The third motor control module controls the auxiliary transmission fluid pump. The hybrid/EV powertrain control module 1 and the motor control modules share the power inverter module ignition voltage circuit, battery voltage circuits and chassis ground. All four modules are flash-programmable microprocessors.

Hybrid Powertrain Control Module

Location

The hybrid/EV powertrain control module 1 is a non-serviceable, flash-programmable microprocessor contained within the power inverter module.

Operating Functions

The hybrid/EV powertrain control module 1 is the main controller of powertrain operation. The hybrid/EV powertrain control module 1 determines when to perform normal operating modes such as electric mode, extended range mode, and regenerative braking. The hybrid/EV powertrain control module 1 also operates in conjunction with the hybrid/EV powertrain control module 2 to determine when to enable and disable the DC high voltage circuits. Each motor control module operates the applicable motor based upon hybrid/EV powertrain control module 1 commands.

Communication and Hosted Diagnostics

The hybrid/EV powertrain control module 1 is the host controller for DTC information for the following control modules:

- Drive motor 1 control module
- Drive motor 2 control module
- Auxiliary transmission fluid pump control module

These modules diagnose their own operation and determine when a fault condition is present.

The motor control modules and the hybrid/EV powertrain control module 1 exchange information and commands on a serial peripheral interface bus internal communication circuit as well as the hi-speed GMLAN communication circuit.

In the event a hosted module communicates a fault condition, the hybrid/EV powertrain control module 1 will determine if one or more operating modes are affected and notify the vehicle operator by requesting the MIL illuminate and/or by displaying a message in the Driver Information Center. In addition, the hybrid/EV powertrain control module 1 will store the associated DTC information for retrieval by a scan tool. Some hosted modules may require an ignition cycle to clear certain DTCs from the hybrid/EV powertrain control module 1.

Circuit Inputs

In addition to data parameters, the hybrid/EV powertrain control module 1 directly monitors the following signal circuits:

- Transmission internal mode switch direction and Park/Neutral switch signals
- Crankshaft position sensor signal

Motor Control Modules

Location

Both of the drive motors and the auxiliary transmission fluid pump motor are located within the transmission. They are each controlled by their own motor control module; each module is a flash-programmable micro-processor. Each motor control module is contained within the power inverter module. Also contained within the power inverter module is the hybrid/EV powertrain control module 1 micro-processor.

Operating Functions

The motor control modules operate their respective motors based upon hybrid/EV powertrain control module 1 commands. Each motor control module controls the speed, direction, and output torque of its respective drive motor or the auxiliary transmission fluid pump through the sequencing actuation of high current switching transistors called insulated gate bipolar transistors.

Communication and Hosted Diagnostics

In addition to the internal serial peripheral interface bus communication circuit that the hybrid/EV powertrain control module 1 and each motor control module control use to communicate, the motor control modules also communicate on the hi-speed and hybrid serial data circuits. The motor control modules do not store their own Diagnostic Trouble Code (DTC) information. The hybrid/EV powertrain control module 1 will store motor control module associated DTC information for retrieval by a scan tool. The scan tool can communicate directly with each motor control module in order to retrieve data parameters only.

Circuit Inputs

In addition to data parameters, each motor control module monitors its respective motor for voltage, current, speed, direction and temperature. Additionally, the motor control module monitors the insulated gate bipolar transistor components for temperature and proper operation. Some of the motor control module operation data is shared with the hybrid/EV powertrain control module 1.

Circuit Outputs

Each motor control module controls its respective insulated gate bipolar transistor driver board that in-turn controls each motor. The motors operate using 3 - phase AC electricity, and are connected directly to the power inverter module via ring terminals and A/C connector rods. A single shielded cable connects the auxiliary transmission fluid pump to the power inverter module. This cable contains 3 individual wires that are connected to the 3 phases of the auxiliary transmission fluid pump. The cable is orange in color to alert the technician to the potential presence of high voltage.

ELECTROMAGNETIC COMPATIBILITY DESCRIPTION

Overview

Vehicles are typically subject to certain legal requirements that limit the amount of electromagnetic interference (EMI) that can be generated by the vehicles electronic devices. Additionally, the electronic devices within the vehicle must be able to withstand a certain amount of EMI without affecting their operation. EMI is generated whenever electrical current flows through a circuit. The amount of EMI generated, or amplitude, is usually dependent upon the amount of current flow, amperage, and the on-off pattern of current flow through the circuit, frequency. The EMI requirements are generally referred to as electromagnetic compatibility.

There are many ways of ensuring the vehicle meets electromagnetic compatibility requirements. These include:

- Adding capacitors and resistors to certain electrical circuits
- Regulating the frequency at which a component may operate
- Shielding the wires, cables and components

Circuit Design

The power inverter module, often referred to as the drive motor generator power inverter module, and the 14 V power module, often referred to as the accessory DC power control module, each contain filter capacitors connected to the high voltage circuits. These capacitors are necessary to reduce the voltage spikes that occur as a result of the switching of current On and Off. Reducing voltage spikes reduces EMI. The frequency of current switching is also closely regulated. Too high a frequency can cause an increase in EMI generation.

Wiring/Cable Design

Different types of wire/cable shielding methods are utilized in the vehicle. Common types of circuit shielding include twisted-pair and internal braid or foil. Twisted pair is typically used in circuits such as serial data circuits. The wire pair is twisted together at a particular turns-per-length ratio. Shielded cable is utilized for all other circuits requiring either protection from external EMI or to reduce EMI radiation of the cable itself into other nearby components or circuits.

High Voltage Cable

- 300-Volt Battery Positive and Negative Cable
- Air Conditioning and Drive Motor Battery Cooling Compressor

The high voltage cables utilize internal braid shielding. Typically, both ends of the internal braid shield are attached to chassis ground. All of the high voltage, internally shielded cables are grounded at their cable end attachment points. Mounting blocks, where used, perform the shield to chassis ground connection. Connection points not serviced with a mounting block utilize a separate ring terminal.

Low and Intermediate Voltage Wiring

The signal circuits for the transmission sensors utilize shielding protection. The drive motor position sensor circuits utilize internal foil shielding. The wiring harness external of the transmission assembly is connected to chassis ground with ring terminals at the power inverter module. The internal transmission wiring harness is attached to chassis ground with a ring terminal at the valve body assembly.

The auxiliary transmission fluid pump 3 phase cables utilize internal foil shielding. The wiring harness shield is connected to chassis ground within the power inverter module.

Component Shielding

Certain components utilize their structure to effectively shield EMI. Metal covers, chassis grounded metal cases and electro-magnetically conductive gaskets may all be part of a components electromagnetic compatibility design.

Shielding Loss

A loss of proper shielding may result in poor AM band radio reception and/or incorrect sensor circuit readings depending upon the location of the shield loss. Damage that has penetrated to the insulated conductor of high voltage cables is not repairable. Certain Low and Intermediate voltage shielded wiring harnesses may be repairable. Refer to [Wiring Repairs](#) , and [Splicing Twisted or Shielded Cable](#) .

HIGH VOLTAGE MONITORING SYSTEMS DESCRIPTION

The hybrid/EV system monitors several high voltage components for attempted access. Additionally, a minimum amount of isolation resistance is maintained at all times between both negative and positive poles of the hybrid/EV battery and the vehicle chassis. Microprocessors internal to the power inverter module, often referred to as the drive motor generator power inverter module, and the hybrid/EV powertrain control module 2 monitor the hybrid/EV system for access and loss of isolation.

High Voltage Interlock Circuit

The high voltage interlock circuit is a wire loop that passes through certain high voltage components. The high voltage interlock circuit is used to determine if access to high voltage components is being attempted. The opening of these high voltage components causes the high voltage interlock circuit to open. The hybrid/EV system may react to the loss of high voltage interlock circuit continuity by opening the high voltage contactor relays and discharging the high voltage capacitors. The high voltage interlock circuit signal is generated by the hybrid/EV powertrain control module 2. The high voltage interlock circuit status is monitored by the hybrid/EV powertrain control module 2.

High Voltage DC Chassis Isolation

Vehicles equipped with high voltage storage and propulsion capability are designed with the high voltage circuits isolated from the vehicle chassis. If either the positive or negative high voltage Direct Current (DC) circuits or any of the high voltage Alternating Current (AC) phase circuits lose this isolation to the vehicle chassis, one or more diagnostic trouble codes (DTCs) may set. Additional information can be found in [Hybrid/EV System High Voltage Isolation Description](#).

HYBRID MODES OF OPERATION DESCRIPTION

Vehicle Operating Modes Description

This vehicle is an Extended Range Electric Vehicle. It uses an electric propulsion system to drive the vehicle at all times. Electricity is the vehicle's primary source of energy, while gasoline is the secondary source.

The vehicle has two modes of operation - Electric and Extended Range. In both modes, the vehicle is propelled by the electric motors that are internal to the transmission. Electrical energy is converted into mechanical energy to drive the wheels and propel the vehicle. The vehicle's performance remains the same in either mode.

This overview is not a comprehensive list of all aspects of the Extended Range Electric Vehicle. Refer to Automatic Transmission 5ET50 [Electronic Component Description](#) for information regarding transmission operation. More detailed and comprehensive information is also available through the dealer training program.

Electric Mode

Electric Mode is the primary mode of operation for this vehicle. While in Electric mode, the vehicle is powered by electrical energy stored in the high voltage hybrid/EV battery pack. The vehicle can operate in this mode for a range of up to 40 - 80 km (25 - 50 miles) until the battery has reached a low state of charge.

Extended Range Mode

When the vehicle reaches the end of its electric range, it switches to Extended Range Mode. In this mode, electricity is produced by the drive motor, which is driven by the internal combustion engine (ICE). This secondary source of electric power extends the vehicle range. Operation will continue in extended range mode until the vehicle can be plugged in to recharge the hybrid/EV battery pack and restore electric mode.

The hybrid/EV battery pack will continue to provide some power and work together with the ICE to provide peak performance when it is required, such as driving up a steep incline or during high acceleration. The hybrid/EV battery pack will not be recharged while in extended range mode.

Internal Combustion Engine (ICE) Starting

This vehicle does not use a 12 V starter motor to crank the ICE. A much more powerful 300 V motor, drive motor 1, located within the transmission is utilized to crank the ICE. Drive motor 1 can rotate the ICE to operating speed within just a few hundred milliseconds. This allows near-instant starting of the ICE.

The vehicle's on-board computers determine when the ICE needs to run. Some of the normal vehicle conditions that force the ICE to run are:

- The hybrid/EV battery pack has a low state of charge
- The hood is open or not completely latched
- The ICE is needed to maintain the hybrid/EV battery pack temperature
- The ICE needs to run for maintenance
- Extremely low ambient temperatures

When the hood is open, the ICE will run without turning off. The hybrid/EV battery pack is neither charged nor discharged when this occurs.

Some hybrid/EV battery pack faults will cause the ICE to run without turning off.

Service Mode

Service Mode is available for service and diagnostics and to verify the proper operation of the MIL and may be required for emission inspection purposes. With vehicle OFF, and the brake pedal not applied, pressing and holding the POWER button for more than 5 seconds will place the vehicle in Service Mode. The instruments and audio systems will operate as they do in ON, but the vehicle will not be able to be driven. The propulsion system will not start in Service Mode.

Engine Unavailable

If the vehicle runs out of fuel, or the power inverter module has detected the ICE will not start due to a malfunction, the vehicle can continue to be driven in Electric Mode.

Propulsion Power is Reduced

This message comes on any time the battery is reporting less than 35 kW of power available for any reason. This message will NOT require service by a dealer unless the Propulsion Power Reduced message is accompanied by a Malfunction Indicator Lamp.

- This message may appear while severe highway grades, even in Mountain Mode.
- This message may appear on start up if the battery is at or below -15°C (5°F), possibly from the vehicle sitting outside unplugged in the winter.
- This message may appear in Normal or Sport mode in non-mountainous terrain, typically with aggressive driving. When this message appears with aggressive driving, the battery reserve has been depleted.

Maintenance Modes

Engine Maintenance Mode

Engine Maintenance Mode runs the engine to keep it in good working condition when the vehicle has been operated in Electric Mode only for a prolonged period. Engine Maintenance Mode will run the ICE, even if the hybrid/EV battery pack state of charge is sufficient to operate the vehicle in Electric Mode.

Fuel Maintenance Mode

When only Electric Mode is used for a prolonged period, Fuel Maintenance Mode will run the ICE to use up old fuel. The ICE will run until enough fresh fuel is added or a low fuel level is detected. During Fuel Maintenance Mode the ICE may cycle on and off.

Regenerative Braking

When the vehicle is coasting or braking the power inverter module may operate the drive motor as a generator in an Electrical Generation Mode. Operating as an electrical generator, the drive motor exerts a driveline load that helps to slow the vehicle. The electrical energy that the drive motor creates is transferred by the power inverter module to the hybrid/EV battery pack. Constant communication between the power inverter module and the electronic brake control module allows the blending of regenerative braking force with hydraulic braking force.

DIAGNOSTIC INFORMATION AND PROCEDURES

HIGH VOLTAGE SAFETY

The High Voltage Safety procedure will perform the following tasks:

- Identify precautions when performing service or inspections.
- Identify labels for components, wire harness, and connectors.
- Identify high voltage insulation glove inspection procedure.

When applicable, additional region-specific high voltage service requirements and/or Dangers will be located in the General Information, Safety Regulations service category and take precedence over the information presented here.

General High Voltage Dangers

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

NOTE: For European Region, a face shield is required in place of safety glasses.

WARNING: High voltage circuits should only be tested using a digital multimeter (DMM) and test leads with at least a CAT III rating, such as the J 39200-A Digital Multimeter. Failure to follow the procedures may result in serious injury or death.

NOTE: For European Region, a special voltage tester such as the EL-52229 may be required. A multimeter that can measure current is prohibited.

WARNING: This vehicle is equipped with a high voltage battery that is completely isolated from the chassis ground. Never utilize AC powered test equipment to probe the high voltage system. Serious injury, death and component damage could occur if the high voltage system is grounded through the electric utility.

Failure to follow the procedure exactly as written may result in serious injury or death.

Precautions when Performing Service or Inspections

- Always verify that the high voltage has been disabled before working on or around high voltage components, wires, cables, or harnesses.
- Remove all metal objects such as rings and watches.
- The **EL-48900** HEV safety kit contains safety cones. Place the safety cones around the vehicle to alert other technicians that you are working on the high voltage system.
- Remove all keyless entry transmitters and the manual service disconnect from the vehicle and secure in a place outside the vehicle.
- Always wear certified and tested high voltage insulation gloves when inspecting or testing any high voltage wires and components.
- Use the "One Hand" rule whenever possible:
 - Work with only one hand.
 - Keep the other hand behind your back.
- DO NOT carry any metal objects such as a mechanical pencil or a measuring tape that could fall and cause a short circuit.
- After removing ring-terminal style high voltage wires, protect and insulate the terminal ends immediately with the **EL-50209** high voltage terminal cover and UL® Listed or equivalent insulation tape rated at a minimum of 600 V.
- Always tighten the high voltage terminal fasteners to the specified torque. Insufficient or excessive torque will cause malfunctions or damage.
- After finishing work on the high voltage systems and before reinstalling the high voltage manual disconnect, inspect for the following:
 - Verify high voltage system integrity and that all connectors are installed.
 - Verify that all tools or loose components have been removed.

Labels for Components, Wire Harness, and Connectors

The wire harnesses and cables for high voltage circuits are encased in an orange colored covering. In addition, high voltage components such as the Energy Storage System and high voltage cables are affixed with "High Voltage" red danger and orange warning labels.

High Voltage Insulation Glove Inspection Procedure

Fig. 17: Glove Inspection Procedure

Courtesy of GENERAL MOTORS COMPANY

The following procedure visually and functionally inspects the insulation gloves to be used while performing service on high voltage systems. This inspection procedure should be performed prior to any procedure that requires the use of class "0" insulation gloves rated at 1000 V.

1. Remove glove from leather protector.
2. Trap air in the glove and seal opening. Pinch or roll the opening closed tightly to prevent any air loss.
3. Press glove to increase pressure.
4. Inspect for the following conditions:
 - Pin holes
 - Air leaks
 - Wear, tears, or abrasions
 - Damp or wet material
 - Expired certification
 - **If any of the above conditions are met**

Do not use the gloves.

- **If none of the above conditions are met**

5. All OK. Gloves are OK to use.

HIGH VOLTAGE DISABLING

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Circuit/System Description

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure utilizes two possible methods to disable high voltage:

NOTE: **The High Voltage Disable procedure, regardless of the method, only de-energizes the high voltage circuits and components outside of the Hybrid/EV battery pack, dangerous voltage levels always exist within the Hybrid/EV battery pack.**

1. Scan Tool Method: The on-vehicle control module software, initiated by the GDS2 scan tool, disables and discharges high voltage outside of the Hybrid/EV battery pack.
2. DMM Method: If the GDS2 Scan Tool Method does not complete or cannot be implemented, A DMM-based physical measurement method is performed at certain high voltage connectors.

A successful GDS2 Scan Tool High Voltage Disable Procedure will:

1. Perform an analysis of the vehicle condition by verifying specific DTCs have run and passed.
2. Calculate the high voltage isolation resistance to the vehicle chassis.
3. Open the high voltage contactor relays and discharge the high voltage system by setting a crash event lockout. When this stage is reached the Clear Secured High Voltage DTCs procedure will have to be performed to enable the system again.
4. Latch a Service Lockout condition to prevent unintended enabling of the high voltage system.
5. Instruct you when to remove the manual service disconnect.
6. Indicate successful high voltage disabling by:
 - Displaying a PROCEDURE COMPLETE message on the scan tool
 - Displaying a CHECK VEHICLE'S HIGH VOLTAGE STATUS message on the scan tool which will require you to verify:
 - Vehicle is displaying an Instrument Cluster DIC message
 - Vehicle is sounding a continuous audible response from the vehicle Pedestrian Alert alarm
 - High Voltage Inverter Voltage parameter on scan tool indicates system high voltage has been lowered to a safe level

An Unsuccessful GDS2 Scan Tool High Voltage Disable Procedure:

If vehicle conditions DO NOT permit the GDS2 scan tool procedure to complete, you will have to verify high voltage disabling by measuring the applicable connectors for safe voltage level with a DMM.

Circuit/System Testing

WARNING: Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING: Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedure exactly as written may result in serious injury or death.

1. Review the high voltage safety information. Refer to [High Voltage Safety](#).

NOTE: Ensure the 12V battery is fully charged and tested prior to continuing.

2. Disconnect and remove all 12 V Battery Chargers and the Charge Cable from the X98 Hybrid Battery Charger Receptacle.

NOTE: If vehicle conditions do not allow for GDS2 scan tool usage, proceed to GDS2 Scan Tool Procedure Unsuccessful below.

3. Access the GDS2 scan tool High Voltage Disable Procedure located under HPCM2 Control Functions.
4. Perform the actions as specified within the GDS2 scan tool procedure.

NOTE: If at any point the GDS2 scan tool displays a "PROCEDURE UNSUCCESSFUL" warning message or you lose communication, stop the GDS2 procedure and proceed to GDS2 Scan Tool Procedure Unsuccessful below.

5. WHEN INSTRUCTED by the GDS2 procedure, remove the S15 Manual Service Disconnect. Refer to [Drive Motor Battery High Voltage Manual Disconnect Lever Replacement](#). Place the S15 Manual Service Disconnect in a secure place outside the vehicle. Cover the exposed high voltage opening with UL listed, or equivalent, insulation tape rated at a minimum of 600 V.
6. Verify the GDS2 scan tool procedure completed successfully by observing a GDS2 scan tool "PROCEDURE COMPLETE" message followed by a "CHECK VEHICLE'S HIGH VOLTAGE STATUS" message. Verify these messages are combined with ALL the following conditions:
 - Continuous Audible Vehicle Response of the Pedestrian Alert alarm
 - DIC message
 - High Voltage Inverter Voltage parameter on scan tool indicates system high voltage is less than 10 volts
 - If the procedure was unsuccessful

Proceed to GDS2 Scan Tool Procedure Unsuccessful below.

- If the procedure successfully completed

1. Turn the vehicle power mode to OFF.
2. Disconnect the 12 V battery. Refer to [Battery Negative Cable Disconnection and Connection](#) . Note: Disconnecting the 12 V battery is the only method to deactivate the audible vehicle response. The audible response will not resume when the 12 V battery is reconnected.

NOTE: You will have to perform the Clear Secured High Voltage DTCs GDS2 scan tool procedure in order to re-enable the high voltage system upon completion of the required vehicle servicing.

3. The high voltage circuits and components OUTSIDE of the Hybrid/EV battery pack are now disabled/discharged.

NOTE: Print the High Voltage Disable Confirmation table if necessary. Circle Steps Completed to identify which components have been disabled.

High Voltage Disable Confirmation Table

Was the GDS2 Scan Tool Procedure SUCCESSFUL?	Circle One:	NO	YES
--	-------------	----	-----

If YES, all high voltage external of the A4 Hybrid/EV Battery Pack is now disabled. Fill-out and Print form as necessary. If NO, perform GDS2 Scan Tool Procedure Unsuccessful steps as required			
Confirm GDS2 Scan Tool Procedure Unsuccessful Steps Completed Below			
High Voltage Components you wish to Disable	GDS2 Scan Tool Procedure Unsuccessful Steps that must be completed	Steps Completed	
• General Vehicle Servicing around or near but not directly at high voltage components • T6 Power Inverter Module and connectors • T12 Transmission and connectors	Steps 1 - 14	NO	YES
• A4 Hybrid/EV Battery Pack - external • 300V cable - A4 Hybrid/EV Battery Pack to T6 Power Inverter Module	Steps 1 - 28	NO	YES
K1 14V Power Module	Steps 1 - 33*	NO	YES
T18 Battery Charger	Steps 1 - 33*	NO	YES
300V cable - A4 Hybrid/EV Battery Pack to K1 14V Power Module and T18 Battery Charger	Steps 1 - 33*	NO	YES
K10 Heater	Steps 1 - 33*	NO	YES
300V cable - A4 Hybrid/EV Battery Pack to K10 Heater	Steps 1 - 33*	NO	YES
G1 A/C Compressor	Steps 1 - 33*	NO	YES
300V cable - A4 Hybrid/EV Battery Pack to G1 A/C Compressor	Steps 1 - 33*	NO	YES
*Perform testing at each component as applicable

GDS2 Scan Tool Procedure Unsuccessful

NOTE: If the GDS2 Scan Tool Procedure was unsuccessful, follow the steps below as applicable.

1. Turn the vehicle power mode to OFF. Remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.
2. Attempt to start the vehicle with the Ignition Mode Switch.

- If the vehicle enters Propulsion System Active mode or the engine starts

Locate and remove all keyless entry transmitters from within the vehicle and return to the beginning of the GDS2 Scan Tool Procedure Unsuccessful procedure.

- If the vehicle did not enter Propulsion System Active mode and the engine did not start

NOTE: The 12 V battery must be disconnected to ensure proper test results.

3. Disconnect the 12 V battery. Refer to [Battery Negative Cable Disconnection and Connection](#)
4. Remove the S15 Manual Service Disconnect. Refer to [Drive Motor Battery High Voltage Manual Disconnect Lever Replacement](#). Place the S15 Manual Service Disconnect in a secure place outside the vehicle. Cover the exposed high voltage opening with ULÂ® listed, or equivalent, insulation tape rated at a minimum of 600 V.

NOTE: **5 min must elapse before removing any high voltage connectors. Removal of non high voltage components is allowed during this wait time.**

5. Wait 5 min before continuing, to allow the high voltage capacitors to discharge.

Fig. 18: T6 Power Inverter Module X1 56-Way Connector Cover, Nut And Bolts
Courtesy of GENERAL MOTORS COMPANY

6. Remove the T6 Power Inverter Module X1 56-way connector cover nut (1) and bolts (2). Remove the cover (3).
7. Disconnect the T6 Power Inverter Module X1 56-way connector.

Fig. 19: T6 Power Inverter Module X2 HV Cable Cover And Remaining Bolt
Courtesy of GENERAL MOTORS COMPANY

8. Remove the T6 Power Inverter Module X2 HV cable cover remaining bolt (1) and HV cable cover (2).

NOTE: A 9 V DC battery or the vehicles 12 V battery can be used to test the DMM.

9. Verify the test DMM by measuring a known good 9 to 12 V battery.

- If the DMM does not properly measure the test battery

Repair or replace the DMM and repeat all voltage measurements.

- If the DMM properly measures the test battery

NOTE:

- Wear your High Voltage Insulation gloves until you have determined that a high voltage exposure risk is no longer present.
- Inspect the High Voltage DC connection seal for deformation or damage. Inspect the High Voltage DC connector for seal residue or debris. Always replace damaged seals and clean seal remnants from the connector with a non-marring tool.

10. Disconnect the T6 Power Inverter Module X2 high voltage harness connector which connects to the A4 Hybrid/EV Battery Pack.

Fig. 20: T6 Power Inverter Module X2 Connector

Courtesy of GENERAL MOTORS COMPANY

NOTE:

5 min must have elapsed since removing the S15 Manual Service Disconnect before continuing to allow the high voltage capacitors to discharge and ensure proper test results.

11. Verify the voltage measures less than 3 V at the T6 Power Inverter Module X2 connector (1) at the following points:

- High voltage DC (-360 V) negative terminal B to vehicle chassis ground.
- High voltage DC (+360 V) positive terminal A to vehicle chassis ground.
- High voltage DC (+360 V) positive terminal A and high voltage DC (-360 V) negative terminal B.
- If 3 V or greater

Leave the DMM connected to the terminals until the voltage drops below 3 V to allow the high voltage capacitors to discharge. Continue to the next step once the voltage is below 3 V.

- **If less than 3 V**

12. Verify the voltage measures less than 3 V at the HV DC harness connector (2) to the T6 Power Inverter Module X2 at the following points:

- High voltage DC (-360 V) negative terminal B to vehicle chassis ground.
- High voltage DC (+360 V) positive terminal A to vehicle chassis ground.
- High voltage DC (+360 V) positive terminal A and high voltage DC (-360 V) negative terminal B.
- **If 3 V or greater**

There is a stuck closed contactor and a loss of isolation within the A4 Hybrid/EV Battery Pack. Refer to [Hybrid/EV Battery Voltage Present.](#)

- **If less than 3 V**

13. Verify the test DMM by measuring a known good 9 to 12 V battery.

- **If the DMM does not properly measure the test battery**

Repair or replace the DMM and repeat all voltage measurements.

- **If the DMM properly measures the test battery**

14. The T6 Power Inverter Module is now discharged. You may perform T6 Power Inverter Module, T12 Transmission or General vehicle service and exit the High Voltage Disabling procedure at this time but you **MUST** continue if additional high voltage component service is required.

- **If you do not need to perform additional high voltage component service**

HV Disable for T6 power inverter module and/or T12 Transmission is complete.

- **If you need to perform additional high voltage component service**

Fig. 21: A28 Hybrid/EV Battery Contactor Assembly Connectors
Courtesy of GENERAL MOTORS COMPANY

15. Disconnect the low voltage harness connectors X357 and X358 at the A28 Hybrid/EV Battery Contactor Assembly.
16. Disconnect the T18 Battery Charger harness connector at the A28 Hybrid/EV Battery Contactor Assembly X6.
17. Verify the voltage measures less than 3 V at the A28 Hybrid/EV Battery Contactor Assembly connector X6 at the following points:
 - High voltage DC (-360 V) negative terminal 2 to vehicle chassis ground.
 - High voltage DC (+360 V) positive terminal 1 to vehicle chassis ground.
 - High voltage DC (+360 V) positive terminal 1 and high voltage DC (-360 V) negative terminal 2.
 - **If 3 V or greater**

There is a stuck closed contactor and a loss of isolation within the A4 Hybrid/EV Battery Pack. Refer to [Hybrid/EV Battery Voltage Present](#).

- **If less than 3 V**

18. Verify the voltage measures less than 3V at the A28 Hybrid/EV Battery Contactor Assembly connector X6 at the T18 Battery Charger harness side at the following points:
 - High voltage DC (-360 V) negative terminal 2 to vehicle chassis ground.
 - High voltage DC (+360 V) positive terminal 1 to vehicle chassis ground.
 - High voltage DC (+360 V) positive terminal 1 and high voltage DC (-360 V) negative terminal 2.
 - **If 3 V or greater**

Leave the DMM connected to the terminals until the voltage drops below 3 V to allow the high voltage capacitors to discharge. Continue to the next step once the voltage is below 3 V.

- **If less than 3 V**

19. Disconnect the G1 A/C Compressor harness connector at the A28 Hybrid/EV Battery Contactor Assembly X5.
20. Verify the voltage measures less than 3 V at the A28 Hybrid/EV Battery Contactor Assembly connector X5 at the following points:
 - High voltage DC (-360 V) negative terminal 2 to vehicle chassis ground.
 - High voltage DC (+360 V) positive terminal 1 to vehicle chassis ground.
 - High voltage DC (+360 V) positive terminal 1 and high voltage DC (-360 V) negative terminal 2.
 - **If 3 V or greater**

There is a stuck closed contactor and a loss of isolation within the A4 Hybrid/EV Battery Pack. Refer to [Hybrid/EV Battery Voltage Present](#).

- **If less than 3 V**

21. Verify the voltage measures less than 3V at the A28 Hybrid/EV Battery Contactor Assembly connector X5 at the G1 A/C Compressor harness side at the following points:
 - High voltage DC (-360 V) negative terminal 2 to vehicle chassis ground.
 - High voltage DC (+360 V) positive terminal 1 to vehicle chassis ground.
 - High voltage DC (+360 V) positive terminal 1 and high voltage DC (-360 V) negative terminal 2.
 - **If 3 V or greater**

Leave the DMM connected to the terminals until the voltage drops below 3 V to allow the high voltage capacitors to discharge. Continue to the next step once the voltage is below 3 V.

- **If less than 3 V**

22. Disconnect the K10 Cabin Heater Control Module harness connector at the A28 Hybrid/EV Battery Contactor Assembly connector X4.
23. Verify the voltage measures less than 3 V at the A28 Hybrid/EV Battery Contactor Assembly connector X4 at the following points:
- High voltage DC (-360 V) negative terminal 2 to vehicle chassis ground.
 - High voltage DC (+360 V) positive terminal 1 to vehicle chassis ground.
 - High voltage DC (+360 V) positive terminal 1 and high voltage DC (-360 V) negative terminal 2.
 - **If 3 V or greater**

There is a stuck closed contactor and a loss of isolation within the A4 Hybrid/EV Battery Pack. Refer to [Hybrid/EV Battery Voltage Present.](#)

- **If less than 3 V**

24. Verify the voltage measures less than 3 V at the A28 Hybrid/EV Battery Contactor Assembly connector X4 at the K10 Cabin Heater Control Module harness side at the following points:
- High voltage DC (-360 V) negative terminal B to vehicle chassis ground.
 - High voltage DC (+360 V) positive terminal A to vehicle chassis ground.
 - High voltage DC (+360 V) positive terminal A and high voltage DC (-360 V) negative terminal B.
 - **If 3 V or greater**

Leave the DMM connected to the terminals until the voltage drops below 3 V to allow the high voltage capacitors to discharge. Continue to the next step once the voltage is below 3 V.

- **If less than 3 V**

25. Disconnect the T6 Power Inverter Module harness connector at the A28 Hybrid/EV Battery Contactor Assembly X3.
26. Verify the voltage measures less than 3 V at the A28 Hybrid/EV Battery Contactor Assembly connector X3 at the following points:
- High voltage DC (-360 V) negative terminal B to vehicle chassis ground.
 - High voltage DC (+360 V) positive terminal A to vehicle chassis ground.
 - High voltage DC (+360 V) positive terminal A and high voltage DC (-360 V) negative terminal B.
 - **If 3 V or greater**

There is a stuck closed contactor and a loss of isolation within the A4 Hybrid/EV Battery Pack. Refer to [Hybrid/EV Battery Voltage Present.](#)

- **If less than 3 V**

NOTE: Discard any 300 V Battery Positive and Negative cable connector seal that may be deformed or damaged. Replace any seal that is deformed, missing, or damaged.

NOTE: A 9 V DC battery or the vehicles 12 V battery can be used to test the DMM.

27. Verify the test DMM by measuring a known good 9 to 12 V battery.

- **If the DMM does not properly measure the test battery**

Repair or replace the DMM and repeat all voltage measurements.

- **If the DMM properly measures the test battery**

28. The high voltage connectors at the A4 Hybrid/EV battery pack are now discharged. You may perform A4 Hybrid/EV battery pack removal and exit the High Voltage Disabling procedure at this time but you **MUST** continue if additional high voltage component service is required.

- **If you do not need to perform additional high voltage component service**

HV Disable for T6 power inverter module, T12 Transmission and A4 Hybrid battery pack is complete.

- **If you need to perform additional high voltage component service**

29. Disconnect the high voltage connector(s) at the component(s) to be serviced.

30. Verify the voltage measures less than 3 V at the Module connector at the following points:

- High voltage DC (-360 V) negative terminal B or 2 to vehicle chassis ground.
- High voltage DC (+360 V) positive terminal A or 1 to vehicle chassis ground.
- High voltage DC (+360 V) positive terminal A or 1 and high voltage DC (-360 V) negative terminal B or 2.
- **If 3 V or greater**

Leave the DMM connected to the terminals until the voltage drops below 3 V to allow the high voltage capacitors to discharge. Continue to the next step once the voltage is below 3 V.

- **If less than 3 V**

31. Repeat the previous step at all high voltage module connectors for any additional high voltage components requiring service.

32. Verify the test DMM by measuring a known good 9 to 12 V battery.

- **If the DMM does not properly measure the test battery**

Repair or replace the DMM and repeat all voltage measurements.

- **If the DMM properly measures the test battery**

33. High voltage is disabled/discharged at all TESTED modules.

HIGH VOLTAGE ENABLING

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Circuit/System Description

The High Voltage Enabling procedure will perform the following tasks:

- Identify how to enable high voltage.
- Verify high voltage system integrity and that all connectors are installed.

Diagnostic Aids

Review the [High Voltage Connectors](#) information for connector identification and the approved procedures for disconnecting and connecting high voltage connectors.

Circuit/System Testing

WARNING: Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING: Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedure exactly as written may result in serious injury or death.

1. Review the high voltage safety information prior to performing the High Voltage Enabling procedure. Refer to High Voltage Safety
2. Ensure that the 12 V battery is disconnected. Refer to Battery Negative Cable Disconnection and Connection

NOTE:

- Always tighten the high voltage fasteners to the specified torque. Insufficient or excessive torque will cause malfunctions or damage.
- The high voltage connectors that have been disconnected do not require a specific sequence when connecting.

3. After finishing work on the high voltage systems and before installing the S15 Manual Service Disconnect, inspect for the following:
 - Verify that all tools or loose components have been removed.
 - Inspect any disconnected 300 V Battery Positive and Negative cable seals for being deformed, missing, or damaged. Replace any seals that are deformed, missing, or damaged.
 - Verify high voltage system integrity and that all connectors are installed.
 - Verify that all high voltage interlock circuit connectors and covers are installed.
 - Install any components or connectors that have been removed or replaced during diagnosis.
4. Install the S15 Manual Service Disconnect (1). Refer to [**Drive Motor Battery High Voltage Manual Disconnect Lever Replacement**](#)
5. Connect the 12 V battery. Refer to [**Battery Negative Cable Disconnection and Connection**](#).
6. Vehicle in Service Mode.
7. Verify if the A4 Hybrid/EV Battery Pack or the K16 Battery Energy Control Module has been replaced.
 - **If the A4 Hybrid/EV Battery Pack or the K16 Battery Energy Control Module has been replaced**

Program the K16 Battery Energy Control Module. Refer to [**Battery Energy Control Module Programming and Setup**](#). Continue to the next step once programming is complete.
 - **If the A4 Hybrid/EV Battery Pack or the K16 Battery Energy Control Module has not been replaced**
8. Verify if the [**High Voltage Disabling**](#) procedure performed prior to vehicle repair utilized the GDS2 scan tool method.
 - **If the GDS2 scan tool high voltage disabling procedure was performed, the high voltage contactor relays are in a lockout state.**

Perform the [**Clear Secured High Voltage DTCs**](#) procedure and return to the next step.
 - **If the DMM Method high voltage disabling procedure was performed**
9. Vehicle in Service Mode, perform the driver window express learn and clear all DTC Information with a scan tool. Refer to [**Window Motor Programming - Express Function**](#).
10. Vehicle OFF and all vehicle systems OFF. It may take up to 5 min for all vehicle systems to power down.
11. Vehicle in Service Mode.
12. Verify with a scan tool no DTCs are set.
 - **If any DTCs are set**

Refer to [**Diagnostic Trouble Code \(DTC\) List - Vehicle**](#).
 - **If no DTCs are set**
13. Vehicle ON. Open the hood to start and idle the engine for 2 min.
14. Vehicle OFF and wait 5 min.
15. Vehicle in Service Mode. Verify with the scan tool the Hybrid/EV Powertrain Control Module and K114B Hybrid/EV Powertrain Control Module 2 DTC Information that the following DTCs have Ran Since Code Clear and have not set:
 - Motor position sensor learn DTCs P0C17 and P0C18.
 - Contactor DTCs P0AD9, P0ADD, P0D0A, and P1EBD.
 - Discharge and Pre-charge DTCs P0C76, P0C77, P0C78 and P0AFB.
 - High voltage loss of isolation DTCs P0AA6, P1AE6, P1AF0 and P1AF2.

- If any DTCs are set

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

- If the DTCs have Not Ran Since Code Clear

1. Review and operate the vehicle according to the applicable DTC Conditions for Running and ensure the DTCs run and pass.
2. Verify with the scan tool the Hybrid/EV Powertrain Control Module and K114B Hybrid/EV Powertrain Control Module 2 DTC Information that the specified DTCs have Ran Since Code Clear and have not set:

- If any DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
- If the DTCs have Ran and Passed

3. Test drive the vehicle and verify no DTCs are set.

- If the DTCs have Ran and Passed

16. Test drive the vehicle and verify no DTCs are set.

WARNING: Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING: Ensure all High Voltage safety procedures are followed. Failure to follow the

procedure exactly as written may result in serious injury or death.

Review the high voltage safety information. Refer to [High Voltage Safety](#).

HV280 Connector Procedure

HV280 Disconnect Procedure

Fig. 23: Connector Position Assurance (CPA) Tab

Courtesy of GENERAL MOTORS COMPANY

1. Pull the connector position assurance (CPA) (1) tab back from the locked position to the pre-stage position. There will be an audible click sound when the CPA tab is in the correct position.

Fig. 24: Female Connector And Female Connector Lock
Courtesy of GENERAL MOTORS COMPANY

NOTE: Pull on the sides of the connectors only. The connector will stop in a partial-mate position when performing the next step.

2. Press firmly on the back of the female connector lock (1) and hold down, while pulling the female connector (2) assembly halfway apart, until the connector is in the partial-mate position.

Fig. 25: Second Connector Lock And Female Connector

Courtesy of GENERAL MOTORS COMPANY

NOTE: If the connector does not separate easily when pulled after the second connector lock is released, check that both sides of the second connector lock have been released.

3. Insert a suitable tool into the slot under the second connector lock (1). Using the tool as a lever, release the female connector by gently raising the second connector lock. An audible click or clicks will be heard on both sides of the connector as the second lock is released.
4. Remove the tool and pull the female connector (2) to fully disconnect.

HV280 Connect Procedure

Fig. 26: Connector Position Assurance (CPA) Tab, Index Guides And Connector
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- Ensure the CPA tab (1) is in the pre-stage position.
- The connector will be fully mated when a series of 2 audible clicks is heard.

1. Align the connector with the index features (2) and install the connector by pushing on the sides of the connector (3).

Fig. 27: Connector Position Assurance (CPA) Tab
Courtesy of GENERAL MOTORS COMPANY

NOTE: There will be an audible click sound when the CPA tab is placed in the locked position. The CPA tab and connector body touch when fully seated.

2. Push the CPA tab (1) forward from the pre-stage position to the locked position.

AMP+HVA280 Connector Procedure

AMP+HVA280 Disconnect Procedure

Fig. 28: Connector Position Assurance (CPA) Tab

1. Pull the connector position assurance (CPA) (1) tab back from the locked position to the pre-stage position. There will be an audible click sound when the CPA tab is in the correct position.

Fig. 29: Female Connector Lock And Female Connector
Courtesy of GENERAL MOTORS COMPANY

NOTE: Pull on the sides of the connectors only. The connector will stop in a partial-mate position when performing the next step.

2. Press firmly on the back of the female connector lock (1) and hold down, while pulling the female connector (2) assembly halfway apart, until the connector is in the partial-mate position.

Fig. 30: Depressing Second Connector Lock To Disconnect Female Connector
Courtesy of GENERAL MOTORS COMPANY

3. Insert a suitable tool into the slot (1) and depress the second connector lock. An audible click will be heard as the second lock is released.
4. Remove the tool and pull the female connector (2) to fully disconnect.

AMP+HVA280 Connect Procedure

Fig. 31: Connector Position Assurance (CPA) Tab, Index Guides And Connector
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- Ensure the CPA tab (1) is in the pre-stage position.
- The connector will be fully mated when a series of two audible clicks is heard.

1. Align the connector with the index features (2) and install the connector by pushing on the sides of the connector (3).

Fig. 32: Connector Position Assurance (CPA) Tab
Courtesy of GENERAL MOTORS COMPANY

NOTE: There will be an audible click sound when the CPA tab is placed in the locked position. The CPA tab and connector body touch when fully seated.

2. Push the CPA tab (1) forward from the pre-stage position to the locked position.

PP2000 Axial Connector Procedure

PP2000 Axial Disconnect Procedure

Fig. 33: Connector Position Assurance (CPA) Tab
Courtesy of GENERAL MOTORS COMPANY

1. Pull the connector position assurance (CPA) tab (1) back from the locked position to the pre-stage position. There will be an audible click sound when the CPA tab is in the correct position.

Fig. 34: Primary Lock Feature

Courtesy of GENERAL MOTORS COMPANY

2. Depress the primary lock feature (1) to release the lever.

Fig. 35: Lift And Rotate Lever

Courtesy of GENERAL MOTORS COMPANY

NOTE: Only rotate the lever until the locks contact each other at the top of the connector (2).

3. Lift and rotate the lever (1) to place the connector in the partial-mate position.

Fig. 36: Connector Lock And Lever

Courtesy of GENERAL MOTORS COMPANY

4. Depress the connector lock (1). Keep the lock depressed and rotate the lever (2) forward to the pre-stage position. There will be an audible click sound when the connector lock disengages.
5. Pull back on the female connector to disconnect the connector completely.

PP2000 Axial Connect Procedure

Fig. 37: Lever, Connector Position Assurance (CPA) Tab And Index Guide

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Using the connector lever to draw the connectors together during the pre-stage position may damage the connector lever pivots. Initial mating of the connector halves **MUST** be performed without the use of the connector lever. Engage the harness connector to the header connector by hand and allow the connector lever to freely rotate from the pre-stage position. Use the lever to fully mate the connector halves only when lever has rotated beyond the pre-stage position.

NOTE: Ensure the lever (1) and CPA tab (2) are in the pre-stage position.

1. Align the connector with the index features (3) and install the connector to the pre-locking position. The lever will be released from its pre-stage position with a short movement.

Fig. 38: Lever And Connector Position Assurance (CPA) Tab
Courtesy of GENERAL MOTORS COMPANY

2. Close the lever (1) to the full-stage position. There will be a very audible click sound.
3. Push the CPA tab (2) to lock the connector in the full-stage position. There will be a very audible click sound when the connector is secured.

PP2000 90 NFS Connector Procedure

PP2000 90 NFS Disconnect Procedure

Fig. 39: Using Tool Through Opening To Unlock Lever
Courtesy of GENERAL MOTORS COMPANY

1. Place a suitable tool, such as a small flat-blade screwdriver, through the opening (1) at the front of the lever, and extend the tip down to near the base of the connector (2).
2. Rotate the tool slightly in either direction to unlock the lever.

Fig. 40: Lever And Female Connector

Courtesy of GENERAL MOTORS COMPANY

3. Rotate the lever (1) to place the connector in a partial-mate position.
4. Remove the female connector (2) to complete the disconnection.

NOTE: **Always clean seal remnants from the connector with a non-marring tool.**

5. Inspect the High Voltage DC harness connector for seal residue or debris. Clean as necessary.
6. Inspect the High Voltage DC header connector seal for deformation or damage. Replace the DC connector header when seal damage is observed.

PP2000 90 NFS Connect Procedure

Fig. 41: Lever In Pre-Stage Assembly Position
Courtesy of GENERAL MOTORS COMPANY

1. Ensure the lever is in the pre-stage assembly position (1).

Fig. 42: Female Connector And Lever

Courtesy of GENERAL MOTORS COMPANY

2. Install the female connector (1) in the partial-mate position.
3. Rotate the lever (2) to place the connector in the full-mate position. There will be a very audible click sound when the lever locks in the full-stage position.

DTC P0A0C OR P0A0D: HIGH VOLTAGE SYSTEM INTERLOCK CIRCUIT VOLTAGE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P0A0C

High Voltage System Interlock Circuit Low Voltage

DTC P0A0D

High Voltage System Interlock Circuit High Voltage

Circuit/System Description

The main high voltage interlock circuit loop is used to determine if access to high voltage components is being attempted. Attempting to gain access to these high voltage components causes the main high voltage interlock circuit to open. The hybrid/EV powertrain control module 2 sources 5 V on the main high voltage interlock circuit loop and monitors the return voltage. A resistor in the manual service disconnect allows the hybrid/EV powertrain control module 2 to detect improper main high voltage interlock circuit voltage, such as open or shorted circuits.

Conditions for Running the DTC

P0A0C

- The 12 V battery voltage is greater than 10.2 V.
- The high voltage contactors are closed.

P0A0D

- The 12 V battery voltage is greater than 10.2 V.
- The hybrid/EV powertrain control module 2 is awake and communicating.

Conditions for Setting the DTC

P0A0C

The hybrid/EV powertrain control module 2 detects main high voltage interlock circuit loop voltage is less than 1.5 V.

P0A0D

- The hybrid/EV powertrain control module 2 detects main high voltage interlock circuit loop voltage is greater than 1.2 V when the circuit is inactive.

OR

- The hybrid/EV powertrain control module 2 detects main high voltage interlock circuit loop voltage is greater than 2.2 V when the circuit is active.

Actions Taken When the DTC Sets

- DTCs P0A0C and P0A0D are Type A DTCs.
- The hybrid/EV powertrain control module 2 opens the high voltage contactors.

Conditions for Clearing the DTC

DTCs P0A0C and P0A0D are Type A DTCs.

Diagnostic Aids

- Test for a fully engaged hybrid battery pack high voltage manual disconnect whenever an open high voltage interlock circuit condition is observed. The hybrid battery pack high voltage manual disconnect must be pressed down fully in order to engage the high voltage interlock circuit terminals.
- The main high voltage interlock circuit is also routed through several inline connectors.

- The hybrid powertrain control module 2 scan tool parameter High Voltage Interlock Circuit Status will indicate Open Circuit whenever improper interlock circuit voltage is observed. Manipulating connections while monitoring the parameter for a change from Closed Circuit to Open Circuit may help locate intermittent connections.

[Control Module References](#) for scan tool information

Special Tools

EL-48900 HEV Safety Kit

For equivalent regional tools, refer to [Special Tools](#).

Circuit/System Verification

1. Vehicle in Service Mode.
2. With a scan tool, observe the hybrid/EV powertrain control module 2 High Voltage Interlock Circuit Status parameter.
 - **The parameter indicates an OPEN CIRCUIT condition.**Refer to Circuit/System Testing
 - **The parameter indicates a CLOSED CIRCUIT condition.**
3. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

NOTE: The main high voltage interlock circuit is routed through several inline connectors and the S15 Manual Service Disconnect. The following steps assume the S15 manual service disconnect and the appropriate inline connectors are connected.

1. Vehicle OFF, disconnect the X357 harness connector at the A4 Hybrid/EV Battery Pack.
2. Vehicle in Service Mode. Test for 4.8V or greater between the 5 V reference circuit terminal 9 and ground.
 - If less than 4.8V
 1. Vehicle OFF, disconnect the X1 connector at the K114B Hybrid/EV Powertrain Control Module 2.
 2. Test for infinite resistance between the 5 V reference circuit terminal 47, X1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the 5 V reference circuit terminal 47 end to end.
 - If 2 Ω or greater, repair the open/high resistance on the circuit.
 - If less than 2 Ω replace the K114B Hybrid/EV Powertrain Control Module 2.
 - If 4.8V or greater

NOTE: Installing a 35 - 50 Ω resistor in place of a jumper should result in a constant Closed Circuit parameter indication.

3. With a scan tool, observe the hybrid/EV powertrain control module 2 High Voltage Interlock Circuit Status parameter while momentarily installing a jumper between the 5V reference circuit terminal 9 and the signal circuit terminal 11, X357. Verify the parameter momentarily indicates a Closed Circuit whenever the jumper is first connected.

- **If the parameter never indicates a Closed Circuit condition**

1. Vehicle OFF, disconnect the X1 connector at the K114B Hybrid/EV Powertrain Control Module 2.
2. Test for infinite resistance between the signal circuit terminal 45 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the signal circuit terminal 45 end to end.
 - If 2 Ω or greater, repair the open/high resistance on the circuit.
 - If less than 2 Ω replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If the parameter will indicate a Closed Circuit condition**

4. Vehicle OFF. Test for 35 - 50 Ω between the 5 V reference circuit terminal 9 and the signal circuit terminal 11, X357 at the A4 Hybrid/EV battery pack.

- **If within the specified range**

All OK.

- **If not within the specified range**

5. Disable the high voltage for servicing at the A4 Hybrid/EV Battery Pack. Refer to [High Voltage Disabling](#).
6. Disconnect the S15 Manual Service Disconnect.
7. Test for 35 - 45 Ω between the high voltage interlock circuit terminals of the S15 Manual Service Disconnect lever, terminal 1 and terminal 2.

- **If not within the specified range**

Replace the S15 Manual Service Disconnect.

- **If within the specified range**

8. Disconnect A4 Hybrid/EV battery pack connector X3.
9. Test for less than 2 Ω between the high voltage interlock circuit terminals of the 300V Battery Positive and Negative Cable.

- **If 2 Ω or greater**

Replace the 300V Battery Positive and Negative Cable assembly.

- **If less than 2 Ω**

10. Replace the A4 Hybrid/EV battery pack.

Component Testing

1. Disconnect the S15 Manual Service Disconnect.
2. Test for 35 - 45 Ω between the following terminals of the S15 Manual Service Disconnect, Terminal 1 and terminal 2.

- **If not within the specified range**

Replace the S15 Manual Service Disconnect.

- **If within the specified range**

3. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Drive Motor Battery High Voltage Manual Disconnect Lever Replacement](#) for S15 Manual Service Disconnect replacement.
- Refer to [Drive Motor Battery Replacement and Shipping Preparation](#) for A4 Hybrid/EV battery pack replacement.
- Refer to [Battery 300-Volt Positive and Negative Cable Replacement - High Voltage Battery to Power Inverter Module and A/C Compressor](#)
- Refer to [Control Module References](#) for hybrid/EV powertrain control module 2 replacement, programming and setup.

DTC P0A7F: HYBRID/EV BATTERY PACK

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P0A7F

Hybrid/EV Battery Pack

Circuit/System Description

The hybrid/EV powertrain control module 2 calculates the high voltage battery pack capability and determines the high voltage battery pack end of life.

Conditions for Running the DTC

- Vehicle ON.
- The system voltage is at least 10.2 V.
- Hybrid battery temperature is greater than 20Â° C (68Â° F).
- Hybrid battery temperature is less than 50Â° C (122Â° F).
- Hybrid battery state of charge is between 15% and 100%.
- When the hybrid/EV powertrain control module 2 calculates the actual battery power has exceeded the power limits multiplied by seconds of duration is greater than 80%.
- None of the following DTCs are set: P0A9C, P0A9D, P0A9E, P0ABB, P0ABC, P0ABD, P0AC1, P0AC2, P0AC6, P0AC7, P0AC8, P0ACB, P0ACC, P0ACD, P0AE9, P0AEA, P0AEB, P0AF8, P0BC3, P0BC4, P0BC5, P0C34, P0C35, P0C36, P0C7D, P0C7E, P0C7F, P0C82, P0C83, P0C84, P0C89, P0C8A, P0C8B, P0C8E, P0C8F, P0C90, P0C93, P0C94, P0C95, P0C98, P0C99, P0C9A, P0CA9, P0CAA, P0CAB, P0CAE, P0CAF, P0CB0, P0CB3, P0CB4, P0CB5, P0CB8, P0CB9, P0CBA, P1A07, P1E8E, P1E8F, P1E90, P1E91, P1E93, P1E94, P1E95, P1E96, P1E97, P1E99, P1E9A, P1E9B, P1E9C, P1E9D, P1E9F, P1EA0, P1EA1, P1EA2, P1EA3, P1EA5, P1EB1, P1EB2, P1EB3, P1EB4, P1EB5, P1EBA, P1EBB, U0111, U185A, U2401, U2603, U2604, U2605, or U2606.

Conditions for Setting the DTC

- Battery voltage and current is varying. Requires more than 10 minutes of city driving.
- The hybrid/EV powertrain control module 2 calculates the power limits is less than the KW end of life power threshold.

Action Taken When the DTC Sets

DTC P0A7F is a type B DTC.

Conditions for Clearing the DTC

DTC P0A7F is a type B DTC.

Diagnostic Aids

Removing the manual service disconnect before disconnecting the 12 V battery may cause a DTC P0A7F to set.

Circuit/System Verification

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.

- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

NOTE: Removing the manual service disconnect before disconnecting the 12 V battery may cause a DTC P0A7F to set. Incorrectly performing the High Voltage Disabling procedure steps will cause false DTCs to set and result in misdiagnosis of vehicle components.

1. Record the freeze frame/failure records.
2. Verify that no other DTCs are set.

- If any other DTCs are set

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#)

- No other DTCs are set

3. Verify DTC P0A7F is set.

- If DTC P0A7F is set

1. Vehicle OFF, disconnect the 12 V battery. Wait 30 seconds, reconnect the 12 V battery. Refer to [Battery Negative Cable Disconnection and Connection](#).
2. Review and operate the vehicle according to the DTC Conditions for Running. Operate the vehicle for more than 10 minutes of city driving.
3. Verify that DTC P0A7F does not reset.
 - If DTC P0A7F resets
 1. Vehicle OFF, disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to [High Voltage Disabling](#).
 2. Remove the A4 Hybrid/EV Battery Pack cover. Refer to [High Voltage Battery Cover Replacement](#).
 3. Inspect all internal high voltage busbar/cable terminals for arc-flash damage.
 - If high voltage terminal damage is present, replace the effected components.
 - If high voltage terminal damage is not present, replace the A4 hybrid/EV battery pack.
 - If DTC P0A7F does not reset
4. All OK.

- If DTC P0A7F is not set

4. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Drive Motor Battery Replacement and Shipping Preparation](#)
- Refer to [Control Module References](#) for battery energy control module and hybrid battery interface control modules replacement, programming and setup.

Hybrid/EV Battery Pack Heater Transistor Control Circuit

Circuit/System Description

The hybrid/EV battery contains 4 high voltage contactors and 1 solid state relay (transistor). The high voltage contactors and transistor allow the high voltage DC batteries to be connected to the vehicle or contain the high voltage DC within the hybrid/EV battery assembly. The 4 high voltage contactors consist of a main positive high voltage contactor, main negative high voltage contactor, charge positive high voltage contactor and a precharge negative high voltage contactor. The transistor controls the battery heater high voltage positive circuit. The contactors and transistor close and open in a specific sequence controlled by the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 supplies voltage to the control circuit for each high voltage contactor/transistor. Ground is provided through a vehicle ground external of the high voltage battery.

Conditions for Running the DTC

P0AA1

- The 12 V battery voltage is greater than 10.2 V.
- The main negative contactor is open.
- The main positive contactor has been open for more than 2 minutes.
- The charger positive contactor has been open for more than 2 minutes.
- None of the following DTCs are set; P0ABB, P0ABC, P0ABD, P0AF8, P1A07, P1AE8, P1AE9, or P1AEC.

P0AA4

- The 12 V battery voltage is greater than 10.2 V.
- The main negative contactor is open.
- The main positive contactor has been open for more than 2 minutes.
- The charger positive contactor has been open for more than 2 minutes.
- Active battery heating is not enabled.
- None of the following DTCs are set; P0ABB, P0ABC, P0ABD, P0AF8, P1A07, P1AE8, P1AE9, or P1AEC.

P0AD9, P0ADD, P0AE4, P0D0A, P1EC3 and P1EBD

The 12 V battery voltage is greater than 10.2 V.

P0AE3

- During precharge mode.
- The negative contactor is open.
- Battery heating is not enabled.

P0D09

- During precharge mode.

- The negative contactor is open.
- The charger contactor is closed.
- Negative bus voltage is greater than 40 V.

P1EC0

- The 12 V battery voltage is greater than 10.2 V.
- The main positive and negative contactors have been closed for more than 1 second.
- The charger positive contactor is closed.
- None of the following DTCs are set; P1AE8, P1AE9, or P1AEC.

Conditions for Setting the DTC

P0AA1

The positive bus voltage is greater than 30 V.

P0AA4

The negative bus voltage is greater than 30 V.

P0AD9, P0ADD and P0D0A

The hybrid/EV powertrain control module 2 has detected an open or short to voltage in the control circuit for the corresponding contactor.

P0AE3

The negative bus voltage is less than 5 V.

P0AE4

The hybrid/EV powertrain control module 2 has detected a short to voltage in the control circuit.

P0D09

The battery charger sensed voltage is less than 10 V.

P1EBD

The battery charger sensed voltage is less than 80% of hybrid/EV battery voltage.

P1EC0

The main bus voltage is less than 80% of hybrid/EV battery voltage.

P1EC3

The hybrid/EV powertrain control module 2 has detected an open, short to ground or short to voltage in the heater transistor control circuit.

Actions Taken When the DTC Sets

- DTCs P0AE3, P0D09, P1EBD, or P1EC0 are type A DTCs.
- DTCs P0AA1, P0AA4, P0AD9, P0ADD, P0AE4, P0D0A, or P1EC3 are type B DTCs.

Conditions for Clearing the DTC

- DTCs P0AE3, P0D09, P1EBD, or P1EC0 are type A DTCs.
- DTCs P0AA1, P0AA4, P0AD9, P0ADD, P0AE4, P0D0A, or P1EC3 are type B DTCs.

Diagnostic Aids

DTC P1EC3 will prevent battery heating and the vehicle will be unable to start in cold weather with battery temperatures below -25°C (-13°F).

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC P0AD9, P0ADD, P0AE4, P0D0A, or P1EC3 is not set.
 - **If any of the DTCs are set**
Refer to Circuit/System Testing.
 - **If none of the DTCs are set**
3. Verify that DTC P0AA1 and/or P0AA4 is set without any of the above contactor Control Circuit DTCs.
 - **If the DTC is set**
Replace the A28 Hybrid/EV Battery Contactor Assembly.
 - **If the DTC is not set**

4. Connect the drive motor battery charger cable. Verify DTC P0D26 is not set and the vehicle will charge.

- **If the DTC is set and the vehicle will not charge**

Refer to [**DTC P0D26**](#) .

- **If the DTC is not set and the vehicle charges**

5. Verify that DTC P0C78 is not set.

- **If the DTC is set**

Refer to [**DTC P0C78 or P3061**](#).

- **If the DTC is not set**

NOTE: **The following setup steps must be performed exactly in order to exercise the contactors.**

6. Ignition OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down.

7. OPEN the driver door using outside door handle. Leave driver door OPEN.

NOTE: **The brake pedal must remain depressed throughout the remainder of the contactor steps.**

8. PRESS and HOLD the brake pedal.

NOTE: **DO NOT press the power button and enter Vehicle in Service Mode.**

9. Command the Hybrid/EV Battery Contactors ALL OPEN with a scan tool.

10. Disconnect the S15 Manual Service Disconnect.

NOTE: **DO NOT use the Release Control button to turn OFF any of the contactors. Once the Release Control button is pushed the Circuit/System Verification will need to be restarted from the beginning.**

11. Command the Hybrid/EV Battery Negative Contactor CLOSED and ALL OPEN with a scan tool while listening for the contactor to close and open.

12. Verify the Hybrid/EV Battery Negative Contactor should be heard closing and opening.

- **If the Hybrid/EV Battery Negative Contactor does not open and close**

Refer to Circuit/System Testing.

- **If the Hybrid/EV Battery Negative Contactor does open and close**

13. Command the Hybrid/EV Battery Positive Contactor CLOSED and ALL OPEN with a scan tool while listening for the contactor to close and open.

14. Verify the Hybrid/EV Battery Positive Contactor should be heard closing and opening.

- **If the Hybrid/EV Battery Positive Contactor does not open and close**

Refer to Circuit/System Testing.

- **If the Hybrid/EV Battery Positive Contactor does open and close**

15. Command the Hybrid/EV Battery Precharge Contactor CLOSED and ALL OPEN with a scan tool while listening for the contactor to close and open.

16. Verify the Hybrid/EV Battery Precharge Contactor should be heard opening and closing.

- **If the Hybrid/EV Battery Precharge Contactor does not open and close**

Refer to Circuit/System Testing.

- **If the Hybrid/EV Battery Precharge Contactor does open and close**

17. Command the Hybrid/EV Battery Charger Contactor CLOSED and ALL OPEN with a scan tool while listening for the contactor to close and open.

18. Verify the Hybrid/EV Battery Charger Contactor should be heard opening and closing.

- **If the Hybrid/EV Battery Charger Contactor does not open and close**

Refer to Circuit/System Testing.

- **If the Hybrid/EV Battery Charger Contactor does open and close**

19. All OK.

Circuit/System Testing

NOTE: You must perform Circuit/System Verification before proceeding.

DTC P0AD9, P0ADD, P0AE4, or P0D0A Contactor Diagnosis

1. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down.
2. Disconnect the X358 harness connector at the A4 Hybrid/EV Battery Pack.
3. Test for less than 10 Ω between the ground circuit terminal 5 and ground.

- **If more than 10 Ω**

1. Vehicle OFF.
2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 10 Ω**

4. Verify that a test lamp illuminates between the B+ circuit terminal 1 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Vehicle OFF.
2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Vehicle OFF.
2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K16 Battery Energy Control Module and A28 Hybrid/EV Battery Contactor Assembly.

- **If the test lamp illuminates**

5. Vehicle OFF, disconnect the X357 harness connector at the A4 Hybrid/EV Battery Pack. Vehicle in Service Mode.

6. Verify that a test lamp does not illuminate between each A4 Hybrid/EV Battery Pack harness connector control

circuit terminals listed below and ground:

- Terminal 2 X357
- Terminal 4 X357
- Terminal 6 X357
- Terminal 7 X357
- **If the test lamp illuminates on any circuit**

1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid Powertrain Control Module 2. Vehicle in Service Mode.
2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K114B Hybrid Powertrain Control Module 2.

- **If the test lamp does not illuminate on all circuits**

7. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid Powertrain Control Module 2.
8. Test for infinite resistance between each A4 Hybrid/EV Battery Pack harness connector control circuit terminals listed below and ground:

- Terminal 2 X357
- Terminal 4 X357
- Terminal 6 X357
- Terminal 7 X357
- **If less than infinite resistance on either circuit**

Repair the short to ground on the circuit.

- **If infinite resistance on both circuits**

9. Test for less than 2 Ω between the harness connector terminals listed below:
 - Terminal 2 X357 at the A4 Hybrid/EV Battery Pack and terminal 9 X1 at the K114B Hybrid Powertrain Control Module 2
 - Terminal 4 X357 at the A4 Hybrid/EV Battery Pack and terminal 6 X1 at the K114B Hybrid Powertrain Control Module 2
 - Terminal 6 X357 at the A4 Hybrid/EV Battery Pack and terminal 8 X1 at the K114B Hybrid Powertrain Control Module 2
 - Terminal 7 X357 at the A4 Hybrid/EV Battery Pack and terminal 3 X1 at the K114B Hybrid Powertrain Control Module 2
 - **If 2 Ω or greater on any circuit**

Repair the open/high resistance in the circuit.

- **If less than 2 Ω on all circuits**

10. Replace the A28 Hybrid/EV Battery Contactor Assembly.
11. Verify that DTC P0C78 or P3061 does not set while operating the vehicle within the Conditions for Running the DTC.

- **If DTC P0C78 or P3061 sets**

Replace the K114B Hybrid Powertrain Control Module 2.

- **If DTC P0C78 or P3061 does not set**

12. All OK.

DTC P1EC3 - Hybrid/EV Battery Pack Heater Transistor Diagnosis

1. Vehicle in Service Mode.
2. Verify that DTC P0AA1, P0AA4, P0AD9, P0ADD, P0AE3, P0AE4, P0D0A, P0D09, P1EBD, or P1EC0, is not set.
 - **If any contactor DTC is set**

Refer to the appropriate contactor Circuit/System Testing.
 - **If no contactor DTC is set**
3. Vehicle OFF, disconnect the X358 harness connector at the A4 Hybrid/EV Battery Pack.
4. Vehicle in Service Mode.
5. Verify that a test lamp does not illuminate between the A4 Hybrid/EV Battery Pack harness control circuit terminal 2 and ground.
 - **If the test lamp illuminates**
 1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid Powertrain Control Module 2. Vehicle in Service Mode.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K114B Hybrid Powertrain Control Module 2.
 - **If the test lamp does not illuminate**
6. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid Powertrain Control Module 2.
7. Test for infinite resistance between the A4 Hybrid/EV Battery Pack harness control circuit terminal 2 and ground.
 - **If less than infinite resistance**

Repair the short to ground on the circuit.
 - **If infinite resistance**

Test for less than 2 Ω in the control circuit end to end.
 - **If 2 Ω or greater**

Repair the open/high resistance in the circuit.
 - **If less than 2 Ω**
8. Perform the [High Voltage Disabling](#) procedure and replace the A28 Hybrid/EV Battery Contactor Assembly.
9. Verify that DTC P1EC3 does not set while operating the vehicle within the Conditions for Running the DTC.
 - **If the DTC is set**

Replace the K114B Hybrid Powertrain Control Module 2.
 - **If the DTC is not set**
10. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [High Voltage Battery Disconnect Relay Replacement](#) for A28 Hybrid/EV Battery Contactor

Assembly replacement.

- Refer to [Control Module References](#) for battery energy control module and hybrid/EV powertrain control module 2 replacement, programming and setup.

DTC P0AA6 OR P1AE6: HYBRID/EV BATTERY VOLTAGE SYSTEM ISOLATION LOST & BATTERY ENERGY CONTROL MODULE HYBRID/EV BATTERY VOLTAGE ISOLATION SENSOR CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P0AA6

Hybrid/EV Battery Voltage System Isolation Lost

DTC P1AE6

Battery Energy Control Module Hybrid/EV Battery Voltage Isolation Sensor Circuit

Circuit/System Description

The vehicle is equipped with a high voltage isolation monitor feature. The purpose of the battery energy control module high voltage isolation monitor circuit is to test the resistance between the high voltage positive and negative direct current (DC) bus and chassis ground. The battery energy control module isolation monitoring method is sometimes referred to as the active isolation monitor. The hybrid powertrain control module 2 requests the battery energy control module to perform this test. Measurement values are reported to the hybrid powertrain control module 2, which makes the determination of an isolation fault.

The isolation check for P0AA6 Hybrid Battery Voltage System Isolation Lost runs when all the contactors are open. This check monitors isolation in the battery system. This check runs only once during the time that the hybrid powertrain control module 2 is awake and runs after the contactors have been open for 35 seconds. This monitor typically runs when the vehicle is turned off after a drive. It could also run when the vehicle is first started, if there is a long enough period between the hybrid powertrain control module 2 waking up and the main contactors closing.

The battery energy control module runs an internal self check of this sensor circuit. When this test fails, DTC P1AE6 will be set.

Conditions for Running the DTC

P0AA6

- The hybrid powertrain control module 2 and battery energy control module are awake and communicating
- All the contactors have been open for 35 seconds.

P1AE6

- The 12 V battery voltage is greater than 11 V.
- The hybrid powertrain control module 2 and battery energy control module are awake and communicating.
- The hybrid powertrain control module 2 has requested the battery energy control module to run the isolation test.

- The main contactors are open.
- DTC U185B is not set.

Conditions for Setting the DTC

P0AA6

- The battery energy control module has detected active isolation resistance is less than 300K Ω if P0AA6 has not failed, or less than 350K Ω if P0AA6 has failed at least once.
- 5 out of 10 tests have failed.

P1AE6

The battery energy control module has detected a fault with the active isolation sensing circuits.

Actions Taken When the DTC Sets

P0AA6 and P1AE6 are Type A DTCs.

Conditions for Clearing the DTC

- P0AA6 and P1AE6 are Type A DTCs.
- P0AA6 requires one passing test at greater than 350K Ω resistance.

Diagnostic Aids

- A single high voltage contactor stuck closed may set this DTC.
- Condensation or water intrusion into the hybrid/EV battery pack may cause P0AA6 or P1AE6 to set.

For equivalent regional tools, refer to [Special Tools](#).

Circuit/System Verification

1. Verify that DTC P0A7E, P0AA1, P0AA4, P0AD9, P0ADD, P0AE3, P0AE4, P0C32, P0D0A, P0D09, P1EBD, P1EC0 or P1EC3 is not set.

- **If any DTC is set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#).

- **If none of the DTCs are set**

2. Verify that DTC P1AE6 is set and P0AA6 is not set.

- **If DTC P1AE6 is set without DTC P0AA6**

Replace the K16 Battery Energy Control Module.

- **If both DTCs are set, or only DTC P0AA6 is set**

3. Verify with a scan tool the hybrid powertrain control module 2, Isolation Test Resistance parameter is greater than 350k Ω .

- **If the parameter is 350k Ω or less**

Refer to Circuit/System Testing.

- **If the parameter is greater than 350k Ω**

4. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.

- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
 - **Visually and functionally inspect the gloves before use.**
 - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to [High Voltage Disabling](#).
2. Remove the Drive Motor Battery Cover. Refer to [High Voltage Battery Cover Replacement](#).
3. Disconnect the harness connector at the E54 Hybrid/EV Battery Pack Coolant Heater.
4. Test for 61 - 75 Ω between terminal A and terminal B at the E54 Hybrid/EV Battery Pack Coolant Heater.

- **If not within the specified range**

Verify that the heater fuse is not blown. Replace the heater fuse if it is blown and the E54 Hybrid/EV Battery Pack Coolant Heater.

- **If within the specified range**

NOTE: Only perform the following continuity tests with the EL-50772 Insulation Multimeter or equivalent.

5. Ensure only the EL-50772 insulation multimeter or equivalent is used with this procedure. Select the Isolation Test setting, then select the 500 V range. Refer to [Troubleshooting With an Insulation Multimeter](#) for important usage instructions.
6. Test for 550M Ω between the E54 Hybrid/EV Battery Pack Coolant Heater terminals listed below and battery tray ground:

- Terminal A
- Terminal B
- **If less than 550M Ω**

Verify that the heater fuse is not blown. Replace the heater fuse if it is blown and the E54 Hybrid/EV Battery Pack Coolant Heater.

- **If 550M Ω or greater**

7. Replace the A4 Hybrid/EV Battery Pack.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [High Voltage Battery Heater Replacement](#)
- Refer to [High Voltage Battery Disconnect Relay Replacement](#) for A28 Hybrid Battery Contactor Assembly replacement
- Refer to [Drive Motor Battery Replacement and Shipping Preparation](#)
- Refer to [Control Module References](#) for K16 battery energy control module replacement, programming and setup.

DTC P0ABB, P0ABC, OR P0ABD: HYBRID/EV BATTERY VOLTAGE SENSOR

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P0ABB

Hybrid/EV Battery Voltage Sensor Performance

DTC P0ABC

Hybrid/EV Battery Voltage Sensor Circuit Low Voltage

DTC P0ABD

Hybrid/EV Battery Voltage Sensor Circuit High Voltage

Circuit/System Description

The hybrid/EV powertrain control module 2 monitors individual cell voltage readings from the battery energy control module. The battery energy control module monitors the voltage of the 96 battery cell groups. Voltage sense lines are attached to each individual cell group, and these sense lines terminate at a connector located on the top surface of the battery section. A voltage sense harness joins this connector to the battery energy control module.

Conditions for Running the DTC

P0ABB

- The hybrid/EV powertrain control module 2 and battery energy control module are awake and communicating.
- DTC U0111 or U185A is not set.

P0ABC and P0ABD

- The hybrid/EV powertrain control module 2 and battery energy control module are awake and communicating.
- The 12 V battery voltage is greater than 10.2 V.
- DTC P1A07 is not set.

Conditions for Setting the DTC

P0ABB

The hybrid/EV powertrain control module 2 detects difference of 12 V between the average cell group voltage multiplied by 96 and the voltage measured at battery side of the main contactors.

P0ABC

The battery energy control module detects the terminal voltage is less than 24 V on the battery side of the main contactors.

P0ABD

The battery energy control module detects the terminal voltage is greater than 479 V on the battery side of the main

contactors.

Actions Taken When the DTC Sets

- DTCs P0ABB, P0ABC, and P0ABD are Type A DTCs.
- The vehicle will operate in a reduced power mode and the extended range mode.

Conditions for Clearing the DTC

DTCs P0ABB, P0ABC, and P0ABD are Type A DTCs.

Diagnostic Aids

- The hybrid/EV battery pack high voltage manual service disconnect is out, not installed correctly, or a blown manual service disconnect fuse may cause P0ABB and/or P0ABC to set.
- The hybrid/EV battery pack high voltage manual service disconnect was removed, out of sequence, or was out during a service procedure with the 12 V battery connected may cause P0ABB and/or P0ABC to set.

CAUTION: The battery energy control modules internal cell balancing circuitry is powered by the cell group voltage sense circuits. In order to prevent an unrecoverable, unbalanced Hybrid/EV battery section or internal control module damage, always take the following actions:

1. Disconnect ALL of the battery energy control module connectors prior to disconnecting any Hybrid/EV battery section connector.
2. Reconnect all the Hybrid/EV battery section connectors prior to reconnecting the battery energy control module connectors.
3. Disconnect and reconnect the battery energy control module connectors ONLY in the sequence provided in Repair Instructions.

- The Hybrid/EV Battery Section schematics in Energy Storage identify the battery section and voltage sense circuit terminal locations appropriate to each cell group.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that no other DTCs are set.
 - **If any DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**

- **If no other DTCs are set**
3. Verify and record with a scan tool, the battery energy control module Hybrid Battery Pack Terminal 1 Voltage parameter and the hybrid/EV powertrain control module 2 Hybrid Battery Pack Voltage parameters are between 205 - 419 V and within 12 V of each other.
 - **If not within the specified range and not within 12 V of each other**

Refer to Circuit/System Testing.

- **If within the specified range and within 12 V of each other**
4. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.

- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
 - **Visually and functionally inspect the gloves before use.**
 - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to [High Voltage Disabling](#)
2. Remove the S15 Manual Service Disconnect.
3. Test for less than 10 Ω across the S15 Manual Service Disconnect fuse terminals.

- **If 10 Ω or greater**

Replace the S15 Manual Service Disconnect.

- **If less than 10 Ω**

4. Remove the A4 hybrid/EV battery pack cover. Refer to [High Voltage Battery Cover Replacement](#).

CAUTION: The battery energy control modules internal cell balancing circuitry is powered by the cell group voltage sense circuits. In order to prevent an unrecoverable, unbalanced Hybrid/EV battery section or internal control module damage, always take the following actions:

1. **Disconnect ALL of the battery energy control module connectors prior to disconnecting any Hybrid/EV battery section connector.**
2. **Reconnect all the Hybrid/EV battery section connectors prior to reconnecting the battery energy control module connectors.**
3. **Disconnect and reconnect the battery energy control module connectors ONLY in the sequence provided in Repair Instructions.**

5. Disconnect all K16 battery energy control module connectors in the sequence provided in Repair Instructions. Refer to [Battery Energy Control Module Replacement](#).

6. Inspect the harness connectors and the 16 battery energy control module connectors for corrosion.

- **If corrosion is present**

Replace the Hybrid/EV Battery Pack Internal Harness and the K16 Battery Energy Control Module as applicable.

- **If corrosion is not present**

NOTE: The Hybrid/EV Battery Section schematics in Energy Storage identify the battery section and voltage sense circuit terminal locations appropriate to each cell group.

7. Disconnect the harness connectors at the C5A Hybrid/EV Battery Module 1 and the C5G Hybrid/EV Battery Module 7.

8. Inspect the harness connector and the appropriate C5 Hybrid/EV Battery Module connector for corrosion.

- **If corrosion is present**

Replace the A4 Hybrid/EV Battery Pack Internal Harness and the C4 Hybrid/EV Battery Section as

applicable.

- **If corrosion is not present**

9. Connect the **EL-48571** High Voltage Battery Pin Out Box with the **EL-48571-55** Battery Pin Out Box Adapter to the appropriate battery module.
10. Insert the DMM probes into the **EL-48571** High Voltage Battery Pin Out Box test cavities.
11. Measure and record the voltage of each of the cell groups by cycling the **EL-48571** High Voltage Battery Pin Out Box through each of the switch positions. Refer to [**EL-48571 High Voltage Battery Pin Out Box Reference**](#).
12. Verify each cell group voltage reading is between 3.45-4.05 V.

- **If not within the specified range**

Replace the appropriate C4 Hybrid/EV Battery Section.

- **If within the specified range**

13. Verify each cell group voltage reading is within 0.03 V of each other.

- **If greater than 0.03 V**

Replace the appropriate C4 Hybrid/EV Battery Section.

- **If 0.03 V or less**

NOTE: If DTC P0ABC or P0ABD are set, only voltage sense circuits 1 or 96 require testing. Perform the following testing at the hybrid/EV battery pack internal wiring harness connector.

14. Test for infinite resistance between each appropriate voltage sense circuit terminals and ground.

- **If less than infinite resistance**

Replace the Hybrid/EV Battery Pack Internal Harness.

- **If infinite resistance**

NOTE: If DTC P0ABC or P0ABD are set, only voltage sense circuits 1 or 96 require testing.

15. Test for less than 2Ω in each appropriate voltage sense circuits end to end.

- **If 2Ω or greater**

Replace the Hybrid/EV Battery Pack Internal Harness.

- **If less than 2Ω**

16. Replace the K16 Battery Energy Control Module.

Repair Instructions

Perform the [**Diagnostic Repair Verification**](#) after completing the repair.

- Refer to [**Drive Motor Battery High Voltage Manual Disconnect Lever Replacement**](#) for S15 manual service disconnect replacement.
- Refer to [**High Voltage Section Battery Replacement \(Battery Section 1\)High Voltage Section Battery Replacement \(Battery Section 2\)High Voltage Section Battery Replacement \(Battery Section 3\)**](#)

- Refer to [Drive Motor Battery Replacement and Shipping Preparation](#)
- Refer to [Auxiliary Battery Wiring Harness Replacement](#)
- Refer to [Control Module References](#) for K16 battery energy control module replacement, programming and setup.

DTC P0AC1, P0AC2, P0B10, P0B11, P0B13, P1EBA, OR P1EBB: HYBRID/EV BATTERY LOW RESOLUTION CURRENT SENSOR & HYBRID/EV BATTERY HIGH RESOLUTION CURRENT SENSOR

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P0AC1

Hybrid/EV Battery Low Resolution Current Sensor Circuit Low Voltage

DTC P0AC2

Hybrid/EV Battery Low Resolution Current Sensor Circuit High Voltage

DTC P0B10

Hybrid/EV Battery High Resolution Current Sensor Circuit Low Voltage

DTC P0B11

Hybrid/EV Battery High Resolution Current Sensor Circuit High Voltage

DTC P0B13

Hybrid/EV Battery Low Resolution Current Sensor - High Resolution Current Sensor Not Plausible

DTC P1EBA

Hybrid/EV Battery Low Resolution Current Sensor Exceeded Learning Limit

DTC P1EBB

Hybrid/EV Battery High Resolution Current Sensor Exceeded Learning Limit

Circuit/System Description

The hybrid/EV battery current sensor is mounted inside the hybrid/EV battery pack. The positive high voltage cable that goes to the positive contactor relay passes through the hybrid/EV battery pack current sensor. The hybrid/EV battery pack current sensor detects the amperage that flows in and out of the hybrid/EV batteries. The battery energy control module supplies and monitors a 5 V reference signal to the hybrid/EV battery pack current sensor. The hybrid/EV battery pack current sensor returns a signal between 0 and 5 V to the battery energy control module. The hybrid/EV battery pack current sensor signal is in proportion to the amperage going in and out of the hybrid/EV battery pack. The hybrid/EV battery pack current sensor has 2 measurement ranges in order to maintain accuracy. The ranges are low resolution and high resolution. The measurement ranges of the hybrid/EV battery pack current

sensor have some overlap with each other. A signal voltage of the high resolution hybrid/EV battery pack current sensor greater than 2.5 V indicates that the hybrid/EV battery is being charged, and a signal voltage less than 2.5 V indicates discharging. A signal voltage of the low resolution hybrid/EV battery pack current sensor greater than 3.24 V indicates that the hybrid/EV battery is being charged and a signal voltage less than 3.24 V indicates discharging. The high resolution measures from -20 to +20 A. The low resolution measures from -500 to +230 A.

Conditions for Running the DTC

P0AC1, P0AC2, P0B10, and P0B11

- The 12 V battery voltage is greater than 10.2 V.
- The battery energy control module is awake and communicating.

P0B13

- The hybrid/EV battery low resolution current sensor or the hybrid/EV battery high resolution current sensor value is between -20 and +20 A.
- None of the following DTCs are set: P0AC1, P0AC2, P1EBA, P1A07, P0B10, P0B11, P0B13, P1EBB, U0111, U185A.

P1EBA and P1EBB

- Runs during battery energy control module initialization.
- The 12 V battery voltage is greater than 10.2 V.
- The high voltage main and charger contactors are open (during wake-up).
- DTC P1A07 is not set.

Conditions for Setting the DTC

P0AC1

The battery energy control module detects that the hybrid/EV battery pack current sensor low resolution is less than -555 A.

P0AC2

The battery energy control module detects that the hybrid/EV battery pack current sensor low resolution is greater than +285 A.

P0B10

The battery energy control module detects that the hybrid/EV battery pack current sensor high resolution is less than -23 A.

P0B11

The battery energy control module detects that the hybrid/EV battery pack current sensor high resolution is greater than +23 A.

P0B13

The difference between the Hybrid/EV Battery's low resolution current sensor value and its high resolution current sensor value is greater than 10 A.

P1EBA

The battery energy control module detects that the Pack Current Low Resolution Offset is greater than the calibration Low Resolution Offset of 8 A.

P1EBB

The battery energy control module detects that the Pack Current High Resolution Offset is greater than the calibration High Resolution Offset of 2.5 A.

Action Taken When the DTC Sets

- DTC P0AC1, P0AC2, P0B10, P0B11, P1EBA and P1EBB are type A DTCs.
- The vehicle will operate in a reduced power mode and the extended range mode.

Conditions for Clearing the DTC

DTC P0AC1, P0AC2, P0B10, P0B11, P1EBA and P1EBB are type A DTCs.

Diagnostic Aids

CAUTION: The battery energy control modules internal cell balancing circuitry is powered by the cell group voltage sense circuits. In order to prevent an unrecoverable, unbalanced Hybrid/EV battery section or internal control module damage, always take the following actions:

1. Disconnect ALL of the battery energy control module connectors prior to disconnecting any Hybrid/EV battery section connector.
2. Reconnect all the Hybrid/EV battery section connectors prior to reconnecting the battery energy control module connectors.
3. Disconnect and reconnect the battery energy control module connectors ONLY in the sequence provided in Repair Instructions.

Circuit/System Verification

1. Vehicle in Service Mode, all accessories OFF.

NOTE: Typical current in a parked vehicle with the Vehicle in Service Mode and all accessories OFF is between 1 A and 10 A.

2. Verify the scan tool battery energy control module Hybrid/EV Battery Pack Low Resolution Current Sensor parameter is between -555 A and +285 A and changes with the amount of current draw on the hybrid/EV battery pack.
 - If not within the specified range
Refer to Circuit/System Testing.
 - If within the specified range

NOTE: Typical current in a parked vehicle with the Vehicle in Service Mode and all accessories OFF is between 1 A and 10 A.

3. Verify the scan tool Hybrid/EV Battery Pack High Resolution Current Sensor parameter is between -23 A and +23 A, and changes with the amount of current draw on the hybrid/EV battery pack.
 - If not within the specified range
Refer to Circuit/System Testing.
 - If within the specified range

4. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal

Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
 - **Visually and functionally inspect the gloves before use.**
 - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to [High Voltage Disabling](#)
2. Remove the A4 Hybrid/EV Battery Pack cover. Refer to [High Voltage Battery Cover Replacement](#)
3. Disconnect the X7 harness connector at the K16 Battery Energy Control Module.

NOTE: **2016 model year and early model year vehicles have an inline 4-wire harness connector, late model and newer vehicles have a 20-wire connector.**

4. Disconnect the A28 Hybrid/EV Battery Contactor Assembly inline connector that contains the B30 Hybrid/EV Battery Pack Current Sensor circuits.

5. Test for less than 2 Ω in the low reference circuit end to end.

- **If 2 Ω or greater**

Replace the Auxiliary Battery Wiring Harness.

- **If less than 2 Ω**

6. Test for less than 2 Ω in the 5V reference circuit end to end.

- **If 2 Ω or greater**

Replace the Auxiliary Battery Wiring Harness.

- **If less than 2 Ω**

7. Test for less than 2 Ω in the low resolution signal circuit end to end.

- **If 2 Ω or greater**

Replace the Auxiliary Battery Wiring Harness.

- **If less than 2 Ω**

8. Test for less than 2 Ω in the high resolution signal circuit end to end.

- **If 2 Ω or greater**

Replace the Auxiliary Battery Wiring Harness.

- **If less than 2 Ω**

9. Test for infinite resistance between the 5 V reference circuit terminal and ground.

- **If less than infinite resistance**

Replace the Auxiliary Battery Wiring Harness.

- **If infinite resistance**

10. Test for infinite resistance between the low resolution signal circuit terminal and ground.

- **If less than infinite resistance**

Replace the Auxiliary Battery Wiring Harness.

- **If infinite resistance**

11. Test for infinite resistance between the high resolution signal circuit terminal and ground.

- **If less than infinite resistance**

Replace the Auxiliary Battery Wiring Harness.

- **If infinite resistance**

NOTE: The B30 Hybrid/EV Battery Pack Current Sensor is not serviced separately.

12. Replace the A28 Hybrid/EV Battery Contactor Assembly.

13. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

14. Verify the DTC does not set.

- **If the DTC sets**

Replace the K16 battery energy control module.

- **If the DTC does not set**

15. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Generator Battery Disconnect Relay Replacement](#) for A28 Hybrid/EV Battery Contactor Assembly replacement
- Refer to [Auxiliary Battery Wiring Harness Replacement](#)
- Refer to [Control Module References](#) for K16 battery energy control module replacement, programming, and setup.

DTC P0AF8: HYBRID SYSTEM VOLTAGE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P0AF8

Hybrid System Voltage

Circuit/System Description

The hybrid battery contains 192 individual cells. Two cells are welded together in parallel and called a cell group. There are a total of 96 cell groups in the hybrid battery assembly. These cell groups are electrically connected in series. Each individual cell group is rated at 3.7 V, for a nominal system voltage of 355 V direct current. The battery cell groups are joined to form 3 distinct sections. The first 24 battery cell groups make up battery section 1. This section is adjacent to the cowl and contains battery cell groups 73 through 96. The next 28 battery cell groups make up battery section 2. This section is located behind section 1 and contains battery cell groups 45 through 72. The transverse battery section is section number 3 and it contains the remaining 44 battery cell groups 1 through 44. The battery sections also contain two temperature sensors, with one sensor located at each end of the section.

The battery energy control module monitors the voltage of the 96 battery cell groups. The voltage sense lines are attached to each individual cell group, and these sense lines terminate at a connector located on the top surface of the battery section. A voltage sense harness joins this connector to the battery energy control module.

The battery energy control module will determine when a fault condition is present. Diagnostics and system status are communicated from the battery energy control module to the hybrid powertrain control module 2 through serial data. The hybrid powertrain control module 2 is the host controller for diagnostic trouble code information.

Conditions for Running the DTC

- The hybrid/EV battery main contactors are closed.
- None of the following DTCs are set; P0ABB, P0ABC, P0ABD, P1A07, P1AE8, P1AE9, P1AEA, P1AEB, P1AEC, P1AED, P1E20, P1E21, P1E28, or U1817.

OR

- Battery charging is active.
- None of the following DTCs are set; P0ABB, P0ABC, P0ABD, P0D4E, P0D4F, P0D5C, P16C5, P1A07, P1EEB, P1EEC, P1ECE, or U1838.

Conditions for Setting the DTC

- The difference between the Hybrid/EV Battery pack voltage and the hybrid/EV powertrain control module 1 bus voltage is greater than 16 V.

OR

- The difference between the Hybrid/EV Battery pack voltage and the charger module's bus voltage is greater than 16 V.

Action Taken When the DTC Sets

- DTC P0AF8 is a type A DTC.
- The vehicle will operate in a reduced power mode and the extended range mode.

Conditions for Clearing the DTC

DTC P0AF8 is a type A DTC.

Diagnostic Aids

- An open charger fuse may cause DTC P0AF8 to set.
- DTC P1EC0 may set a DTC P0AF8 if the vehicle is ON or vehicle in service mode while the contactors are stuck OPEN

Special Tools

EL-48900 HEV Safety Kit

For equivalent regional tools, refer to Special Tools.

Circuit/System Verification

1. Verify that no other DTCs are set.

- **If any DTCs are set**

Refer to Diagnostic Trouble Code (DTC) List - Vehicle

- **If no DTCs are set**

2. Ensure the battery charge cord is not connected.

3. Vehicle ON.

NOTE: **The contactors must be closed.**

4. Verify with a scan tool, the hybrid/EV powertrain control module 1 High Voltage Circuit and the battery energy control module Hybrid Battery Pack Terminal 1 Voltage are within 16 V of each other and DTC P0AF8 did not reset.

- **If the parameters are not within 16 V of each other or DTC P0AF8 is set**

Refer to Circuit/System Testing, Battery Main Bus Diagnostics.

- **If the parameters are within 16 V of each other and DTC P0AF8 is not set**

5. Connect the battery charge cord.
6. Verify with a scan tool, the hybrid/EV powertrain control module 2 Battery Charger High Output and the battery energy control module Hybrid Battery Pack Terminal 1 Voltage are within 16 V of each other and DTC P0AF8 did not reset.

- **If the parameters are not within 16 V of each other or DTC P0AF8 is set**

Refer to Circuit/System Testing, Battery Charger Bus Diagnostics.

- **If the parameters are within 16 V of each other and DTC P0AF8 is not set**

7. All OK

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

Battery Charger Bus Diagnostics

1. Vehicle OFF, disable the high voltage at the T18 Battery Charger. Refer to [High Voltage Disabling](#).
2. Disconnect the T18 Battery Charger high voltage DC connector.
3. Disconnect the K1 14V Power Module high voltage connector.

Fig. 43: A4 Hybrid/EV Battery Pack Connector Identification
Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the X6 harness connector at the A4 Hybrid/EV Battery Pack.
5. Test for infinite resistance between the High voltage DC (+360 V) positive terminal A and the high voltage DC (-360 V) negative terminal B X6 harness connector.
 - **If less than infinite resistance**

Replace the high voltage DC cables. After the repair is complete with a scan tool, the **Clear Secured High Voltage DTCs** reset function must be performed.
 - **If infinite resistance**
6. Test for less than 10 Ω between the terminals listed below:
 - High voltage DC (-360 V) negative terminal B harness connector at the T18 Battery Charger and the high voltage DC (-360 V) negative terminal B X6 harness connector at the A4 Hybrid/EV Battery Pack.
 - High voltage DC (+360 V) positive terminal A harness connector at the T18 Battery Charger and the high voltage DC (+360 V) negative terminal A X6 harness connector at the A4 Hybrid/EV Battery Pack.
 - **If 10 Ω or greater**

Replace the high voltage DC cables. After the repair is complete with a scan tool, the **Clear Secured High Voltage DTCs** reset function must be performed.
 - **If less than 10 Ω**
7. Replace the T18 Battery Charger and the fuse, if open.
8. Verify that DTC P0AF8 does not set while operating the vehicle within the Conditions for Running the DTC.
 - **If DTC P0AF8 sets**

Replace the K1 14V Power Module and the fuse, if open.
 - **If DTC P0AF8 does not set**
9. Verify that DTC P0AF8 does not set while operating the vehicle within the Conditions for Running the DTC.
 - **If DTC P0AF8 sets**

Replace the high voltage battery disconnect relay assembly.
 - **If DTC P0AF8 does not set**

10. All OK.

Battery Main Bus Diagnostics

1. Vehicle OFF, disable the high voltage at the T6 Power Inverter Module. Refer to [High Voltage Disabling](#).
2. Disconnect the X3 harness connector at the A4 Hybrid/EV Battery Pack.
3. Disconnect the high voltage connector at the T6 power inverter module.
4. Test for infinite resistance between the High voltage DC (+360 V) positive terminal A and the high voltage DC (-360 V) negative terminal B X3 harness connector.

- **If less than infinite resistance**

Replace the high voltage DC cables. After the repair is complete with a scan tool, the [Clear Secured High Voltage DTCs](#) reset function must be performed.

- **If infinite resistance**

5. Test for less than 10 Ω between the terminals listed below:

- High voltage DC (-360 V) negative terminal B X3 harness connector at the A4 Hybrid/EV Battery Pack and the high voltage DC (-360 V) negative terminal B harness connector at the T6 Power Inverter Module.
- High voltage DC (+360 V) positive terminal A X3 harness connector at the A4 Hybrid/EV Battery Pack and the high voltage DC (+360 V) negative terminal A harness connector at the T6 Power Inverter Module.

- **If 10 Ω or greater**

Replace the high voltage DC cables. After the repair is complete with a scan tool, the [Clear Secured High Voltage DTCs](#) reset function must be performed.

- **If less than 10 Ω**

6. Replace the T6 Power Inverter Module.
7. Verify that DTC P0AF8 does not set while operating the vehicle within the Conditions for Running the DTC.

- **If DTC P0AF8 sets**

Replace the high voltage battery disconnect relay assembly.

- **If DTC P0AF8 does not set**

8. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Battery 300-Volt Positive and Negative Cable Replacement - High Voltage Battery to Power Inverter Module and A/C Compressor](#)
- Refer to [Battery 300-Volt Positive and Negative Cable Replacement - High Voltage Battery to Charger Receptacle, Accessory DC Power Control Module, and Drive Motor Battery Charger](#)
- Refer to [Drive Motor Battery Charger Replacement](#) for T18 Battery Charger replacement.
- Refer to [Accessory DC Power Control Module Replacement](#) for K1 14V Power Module replacement.
- Refer to [High Voltage Battery Disconnect Relay Fuse Replacement \(Front - BDU\)High Voltage Battery Disconnect Relay Fuse Replacement \(Rear - BDU\)](#)
- Refer to [High Voltage Battery Disconnect Relay Replacement](#) for high voltage battery disconnect relay

assembly.

- Refer to [Control Module References](#) for battery charger, power inverter module replacement, programming and setup.

DTC P0AFA OR P0AFB: HYBRID/EV BATTERY SYSTEM VOLTAGE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P0AFA

Hybrid/EV Battery System Voltage Low Voltage

DTC P0AFB

Hybrid/EV Battery System Voltage High Voltage

Circuit/System Description

The battery energy control module will diagnose its own systems and determine when a fault condition is present. Diagnostics and system status is communicated from the battery energy control module to the hybrid/EV powertrain control module 2 through serial data. The hybrid/EV powertrain control module 2 is the host controller for diagnostic trouble code (DTC) information. The battery energy control module monitors the hybrid/EV battery voltage at the battery side of the high voltage main contactors.

Conditions for Running the DTC

- The battery energy control module is awake and communicating.
- None of the following DTCs are set; P0ABC, P0ABD, P1A07, P0AF8, P0ABB, U0111, U185A.

Conditions for Setting the DTC

P0AFA

The Hybrid Battery Pack Voltage initially is less than 148.9 V and does not exceed 164.9 V.

OR

The Minimum Hybrid Battery Cell Group Voltage in the hybrid battery initially is less than 1.55 V and does not exceed 1.72 V.

P0AFB

The Hybrid Battery Pack Voltage is greater than 438 V.

OR

The Maximum Hybrid Battery Cell Group Voltage in the hybrid battery is greater than 4.56 V.

Action Taken When the DTC Sets

- DTCs P0AFA and P0AFB are type A DTCs.
- The vehicle will operate in a reduced power mode and the extended range mode.
- Once the vehicle has been turned OFF, the hybrid/EV powertrain control module 2 will not CLOSE the high voltage contactors until the DTC has been cleared.

Conditions for Clearing the DTC

- DTCs P0AFA and P0AFB are type A DTCs.
- The Clear Secured High Voltage DTCs reset function must be performed with a scan tool before clear codes.

Diagnostic Aids

CAUTION: The battery energy control modules internal cell balancing circuitry is powered by the cell group voltage sense circuits. In order to prevent an unrecoverable, unbalanced Hybrid/EV battery section or internal control module damage, always take the following actions:

1. Disconnect ALL of the battery energy control module connectors prior to disconnecting any Hybrid/EV battery section connector.
2. Reconnect all the Hybrid/EV battery section connectors prior to reconnecting the battery energy control module connectors.
3. Disconnect and reconnect the battery energy control module connectors ONLY in the sequence provided in Repair Instructions.

The hybrid/EV battery pack high voltage manual service disconnect is not installed correctly, or a blown manual service disconnect fuse will cause P0AFA to set.

For equivalent regional tools, refer to [Special Tools](#).

Circuit/System Verification

1. Record the freeze frame/failure records.

NOTE: An intermittent condition is more likely to be present with a low state of charge. **DO NOT** plug in the vehicle to charge the hybrid/EV battery pack.

2. Vehicle in Service Mode.
3. Verify that DTC P0AA1, P0AD9, P0ADD, P0AE2, P0AE4, P0B3B, P0B3C, P0B3D, P0B3E, P0B40, P0B41, P0B42, P0B43, P0B45, P0B46, P0B47, P0B48, P0B4A, P0B4B, P0B4D, P0B4C, P0B4F, P0B50, P0B51, P0B52, P0B54, P0B55, P0B56, P0B57, P0B59, P0B5A, P0B5B, P0B5C, P0B5E, P0B60, P0B5F, P0B61, P0B63, P0B64, P0B65, P0B66, P0B69, P0B68, P0B6A, P0B6D, P0B6B, P0B6E, P0B70, P0B6F, P0B72, P0B74, P0B73, P0B75, P0B77, P0B78, P0B79, P0B7A, P0B7D, P0B7C, P0B7E, P0B7F, P0B81, P0B82, P0B83, P0B84, P0B86, P0B87, P0B88, P0B89, P0B8B, P0B8C, P0B8D, P0B8E, P0B90, P0B91, P0B92, P0B93, P0B95, P0B96, P0B97, P0B98, P0B9A, P0B9B, P0B9C, P0B9D, P0B9F, P0BA1, P0BA0, P0BA2, P0BA4, P0BA5, P0BA6, P0BA7, P0BA9, P0BAA, P0BAB, P0BAC, P0BAE, P0BAF, P0BB0, P0BB1, P0BB3, P0BB4, P0BB5, P0BB6, P0BB8, P0BB9, P0BBA, P0BBB, P0D0A, P0D11, P1B16, P1B17, P1B18, P1B19, P1B1A, P1B1B, P1B1C, P1B1D, P1B1E, P1B1F, P1B20, P1B21, P1B22, P1B23, P1B24, P1B25, P1B26, P1B27, P1B28, P1B29, P1B2B, P1B2A, P1B2C, P1B2D, P1B45, P1B46, P1B47, P1B48, P1B49, P1B4A, P1B4B, P1B4C, P1B4D, P1B4E, P1B4F, P1B50, P1B51, P1B52, P1B53, P1B54, P1B55, P1B56, P1B57, P1B58, P1B59, P1B5A, P1B5B, P1B5C, P1B5D, P1B5E, P1B5F, P1B60, P1B61, P1B62, P1B63, P1B64, P1B65, P1B66, P1B67, P1B68, P1B69, P1B6A, P1B6B, P1B6C, P1B6D, P1B6E, P1B6F, P1B70, P1B71, P1B72, P1B73, P1B74, P1B75, P1B76, P1B77, P1B78, P1B79, P1B7A, P1B7B, P1B7C, P1B7D, P1B7F, P1B7E, P1B80, P1B81, P1B82, P1B83, P1B84, P1B85, P1B86, P1B87, P1B88, P1B89, P1B8A, P1B8B, P1B8C, P1B8D, P1B8E, P1B8F, P1B90, P1B91, P1B92, P1B93, P1B94, P1B95, P1B97, P1B96, P1B98, P1B99, P1B9A, P1B9B, P1B9C, P1B9D, P1B9E, P1B9F, P1BA0, P1BA1, P1BA2, P1BA3, P1BA4, P1BA5, P1BA6, P1BA7, P1BA8, P1BA9, P1BAB, P1BAA, P1BAC, P1BAD, P1BAE, P1BAF, P1BB0, P1BB1, P1BB2, P1BB3, P1BB4, P1BB5, P1BB6, P1BB7, P1BB8, P1BB9, P1BBA, P1BBB, P1BBC, P1BBD, P1BBE, P1BBF, P1BC0, P1BC1, P1BC2, P1BC3, P1BC4, P1BC5, P1BC6, P1BC7, P1BC8, P1BC9, P1BCA, P1BCB, P1BCC, P1BCE, P1BCD, P1BCF, P1BD0, P1BD2, P1BD1, P1BD3, P1BD4, P1BD5, P1BD6, P1BD7, P1BD8, P1BD9, P1BDA, P1BDB, P1BDD, P1BDC, P1BDE, P1BDF, P1BE1, P1BE0, P1BE3, P1BE2, P1BE4, P1BE5, P1BE6, P1BE7, P1BE8, P1BE9, P1BEA, P1BEB, P1BEC, P1BED, P1BEE, P1BF0, P1BEF, P1BF1, P1BF2, P1BF4, P1BF3, P1BF5, P1BF4, P1BF7, P1BF8, P1BF9, P1BFA, P1BFB, P1BFC, P1BFD, P1BFE, P1E01, P1E02, P1E03, P1E04, P1E05, P1E06, P1E4C, P1E4D, P1E4E, P1E4F, P1E50, P1E51, P1E52, P1E53, P1E54, P1E55, P1E56, P1E57, P1E58, P1E59, P1E5A, P1E5B, P1E5C, P1E5D, P1E5E, P1E5F, P1E60, P1E62, P1E61, P1E63, P1E64, P1E65, P1E66, P1E67, P1E68, P1E69, P1E6A, P1E6B, P1E6D, P1E6C, P1E6E, P1E6F, P1E70, P1E71, P1E72, P1E73, P1E74, P1E76, P1E75, P1E77, P1E78, P1E79, P1E7A, P1E7B, P1E7C, P1E7D, P1E7E, P1E7F, P1E80, P1E81, P1E82, P1E83, P1E84, P1E85, P1E86, P1E87, P1E88, P1E89, P1E8A, P1EBC, P1EBF, P1EC0, P1EC3, P1EC4, P1EC5, U2603, U2604, U2605, U2606, or U2401 is not set.

- If any of the DTCs are set

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#)

- **If none of the DTCs are set**

4. Verify the scan tool Hybrid/EV Battery Pack Terminal 1 Voltage is between 164.9 - 438 V.

- **If not within the specified range**

Refer to Circuit/System Testing, Hybrid Battery Pack Voltage Diagnosis.

- **If within the specified range**

5. Verify the scan tool Hybrid/EV Battery 1 - 96 voltages are between 3.45-4.56 V and all readings are within 0.03 V of each other.

- **If not between 3.45-4.56 V or not within 0.03 V of each other**

Refer to Circuit/System Testing, Hybrid Battery 1 - 96 Cell Group Diagnosis.

- **If between 3.45-4.56 V and within 0.03 V of each other**

NOTE: If the freeze frame/failure records were not initially stored, operate the vehicle under high hybrid/EV battery load conditions, such as hard acceleration, and attempt to set the DTC.

6. Review the freeze frame/failure records. Verify the stored Hybrid/EV Battery 1 - 96 voltages were all between 3.45 - 4.56 V and all readings were within 0.03 V of each other at the time the DTC set.

- **If not between 3.45 - 4.56 V or not within 0.03 V of each other**

Replace the appropriate C4 Hybrid/EV Battery Section.

- **If between 3.45 - 4.56 V and within 0.03 V of each other**

7. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

Hybrid Battery Pack Voltage Diagnosis

1. Vehicle OFF, disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to [High Voltage Disabling](#)
2. Remove the S15 manual service disconnect.
3. Test for less than 10 Ω across the S15 manual service disconnect fuse terminals.

- **If 10 Ω or greater**

Replace the S15 manual service disconnect and repeat Circuit/System Verification.

- **If less than 10 Ω**

4. Remove the A4 hybrid/EV battery pack cover. Refer to [High Voltage Battery Cover Replacement](#)
5. Install a known good S15 manual service disconnect.

WARNING: High voltage circuits should only be tested using a digital multimeter (DMM) and test leads with at least a CAT III rating, such as the J 39200-A Digital Multimeter. Failure to follow the procedures may result in serious injury or death.

NOTE: You are testing high voltage.

6. Test for 164.9 - 438 V between the negative (300 V) C5A and positive (300 V) C5G at the A28 Hybrid/EV Battery Contactor Assembly.

- **If not within the specified range**

Replace the A4 Hybrid/EV Battery Pack. After the repair is complete with a scan tool, the [Clear Secured High Voltage DTCs](#) reset function must be performed.

- **If within the specified range**

7. Replace the K16 Battery Energy Control Module. Disconnect and reconnect the battery energy control module connectors ONLY in the sequence provided in Repair Instructions. After the repair is complete with a scan tool, the [Clear Secured High Voltage DTCs](#) reset function must be performed.

Hybrid Battery 1 - 96 Cell Group Diagnosis

1. Vehicle OFF, disable the high voltage at the A4 hybrid/EV battery pack. Refer to [High Voltage Disabling](#).
2. Remove the A4 hybrid/EV battery pack cover. Refer to [High Voltage Battery Cover Replacement](#)

CAUTION: The battery energy control modules internal cell balancing circuitry is powered by the cell group voltage sense circuits. In order to prevent an unrecoverable, unbalanced Hybrid/EV battery section or internal control module damage, always take the following actions:

1. Disconnect ALL of the battery energy control module connectors prior to disconnecting any Hybrid/EV battery section connector.
2. Reconnect all the Hybrid/EV battery section connectors prior to reconnecting the battery energy control module connectors.
3. Disconnect and reconnect the battery energy control module connectors ONLY in the sequence provided in Repair Instructions.

3. Disconnect all K16 battery energy control module connectors in the sequence provided in Repair Instructions. Refer to [Battery Energy Control Module Replacement](#).

NOTE: The Hybrid/EV Battery Section schematics in Energy Storage identify the battery section and voltage sense circuit terminal locations appropriate to each cell group and corresponding DTC.

4. Disconnect the harness connector at the appropriate C4 Hybrid/EV Battery Section connector.
5. Connect the **EL-48571** High Voltage Battery Pin Out Box with the **EL-48571-55** Battery Pinout Box Adapter to the appropriate battery section.
6. Insert the DMM probes into the **EL-48571** test cavities.
7. Measure and record the voltage of each of the cell groups by cycling the **EL-48571** through each of the switch positions. Refer to [EL-48571 High Voltage Battery Pin Out Box Reference](#)
8. Verify each cell group voltage reading is between 3.45-4.05 V.

- **If not within the specified range**

Replace the appropriate C4 Hybrid/EV Battery Section.

- **If within the specified range**

9. Verify each cell group voltage reading is within 0.03 V of each other.

- **If greater than 0.03 V**

Replace the appropriate C4 hybrid/EV battery section.

- **If 0.03 V or less**

10. Test for infinite resistance between each appropriate voltage sense circuit terminals and ground.

- **If less than infinite resistance**

Replace the Hybrid/EV Battery Pack Internal Harness.

- **If infinite resistance**

11. Test for less than 2 Ω in each appropriate voltage sense circuits end to end.

- **If 2 Ω or greater**

Replace the Hybrid/EV Battery Pack Internal Harness.

- **If less than 2 Ω**

12. Replace the K16 Battery Energy Control Module. After the repair is complete with a scan tool, the [Clear Secured High Voltage DTCs](#) reset function must be performed.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Drive Motor Battery High Voltage Manual Disconnect Lever Replacement](#) for S15 manual service disconnect replacement.
- Refer to [High Voltage Section Battery Replacement \(Battery Section 1\)High Voltage Section Battery Replacement \(Battery Section 2\)High Voltage Section Battery Replacement \(Battery Section 3\)](#)
- Refer to [Auxiliary Battery Wiring Harness Replacement](#) for Hybrid/EV Battery Pack Internal Harness replacement
- Refer to [Drive Motor Battery Replacement and Shipping Preparation](#)

- Refer to [Control Module References](#) for K16 battery energy control module replacement, programming and setup.

DTC P0B3B-P0BBB, P1B16-P1B2D, P1B45-P1BFE, P1E01-P1E06, OR P1E4C-P1E8B: HYBRID/EV BATTERY CIRCUITS

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Hybrid/EV Battery 96 Circuit

Circuit/System Description

The hybrid battery contains 192 individual cells. Two cells are welded together in parallel and called a cell group. There are a total of 96 cell groups in the hybrid battery assembly. These cell groups are electrically connected in series. Each individual cell group is rated at 3.7 V, for a nominal system voltage of 355 V direct current. The battery cell groups are joined to form 3 distinct sections. The first 24 battery cell groups make up battery section 1. This section is adjacent to the cowl and contains battery cell groups 73 through 96. The next 28 battery cell groups make up battery section 2. This section is located behind section 1 and contains battery cell groups 45 through 72. The transverse battery section is section number 3 and it contains the remaining 44 battery cell groups 1 through 44. The battery sections also contain two temperature sensors, with one sensor located at each end of the section.

The battery energy control module monitors the voltage of the 96 battery cell groups. The voltage sense lines are attached to each individual cell group, and these sense lines terminate at a connector located on the top surface of the battery section. A voltage sense harness joins this connector to the battery energy control module.

The battery energy control module will determine when a fault condition is present. Diagnostics and system status are communicated from the battery energy control module to the hybrid powertrain control module 2 through serial data. The hybrid powertrain control module 2 is the host controller for diagnostic trouble code information.

Conditions for Running the DTC

DTC P0B3B, P0B3D, P0B3E, P0B40, P0B42, P0B43, P0B45, P0B47, P0B48, P0B4A, P0B4C, P0B4D, P0B4F, P0B51, P0B54, P0B52, P0B56, P0B57, P0B59, P0B5B, P0B5C, P0B5E, P0B60, P0B61, P0B63, P0B65, P0B66, P0B68, P0B6A, P0B6B, P0B6D, P0B6F, P0B70, P0B72, P0B74, P0B75, P0B77, P0B79, P0B7A, P0B7C, P0B7E, P0B7F, P0B81, P0B83, P0B84, P0B86, P0B88, P0B89, P0B8B, P0B8D, P0B8E, P0B90, P0B92, P0B93, P0B95, P0B97, P0B98, P0B9A, P0B9C, P0B9D, P0B9F, P0BA1, P0BA2, P0BA4, P0BA6, P0BA7, P0BA9, P0BAB, P0BAC, P0BAE, P0BB0, P0BB1, P0BB3, P0BB5, P0BB6, P0BB8, P0BBA, P0BBB, P1B17, P1B18, P1B1A, P1B1B, P1B1D, P1B1E, P1B20, P1B21, P1B23, P1B24, P1B26, P1B27, P1B28, P1B29, P1B2A, P1B2B, P1B2C, P1B2D, P1B46, P1B47, P1B4A, P1B4C, P1B4D, P1B4F, P1B50, P1B52, P1B53, P1B55, P1B56, P1B58, P1B59, P1B5B, P1B5C, P1B5E, P1B5F, P1B61, P1B64, P1B62, P1B65, P1B67, P1B68, P1B6A, P1B6B, P1B6D, P1B6E, P1B70, P1B71, P1B73, P1B74, P1B76, P1B77, P1B79, P1B7A, P1B7C, P1B7D, P1B7F, P1B80, P1B82, P1B83, P1B85, P1B86, P1B88, P1B89, P1B8B, P1B8C, P1B8E, P1B8F, P1B91, P1B92, P1B94, P1B95, P1B97, P1B98, P1B9A, P1B9B, P1B9D, P1B9E, P1BA0, P1BA1, P1BA3, P1BA4, P1BA6, P1BA7, P1BA9, P1BAA, P1BAC, P1BAD, P1BAF, P1BB0, P1BB2, P1BB3, P1BB5, P1BB6, P1BB8, P1BB9, P1BBB, P1BBC, P1BBE, P1BBF, P1BC1, P1BC2, P1BC4, P1BC5, P1BC7, P1BC8, P1BCA, P1BCB, P1BCD, P1BCE, P1BD0, P1BD1, P1BD3, P1BD4, P1BD6, P1BD7, P1BD9, P1BDA, P1BDC, P1BDD, P1BDF, P1BE0, P1BE2, P1BE3, P1BE5, P1BE6, P1BE8, P1BE9, P1BEB, P1BEC, P1BEE, P1BEF, P1BF1, P1BF2, P1BF4, P1BF5, P1BF7, P1BF8, P1BFA, P1BFB, P1BFD, P1BFE, P1E02, P1E03, P1E05, P1E06, P1E4C, P1E4D, P1E4E, P1E4F, P1E50, P1E51, P1E52, P1E53, P1E54, P1E55, P1E56, P1E57, P1E58, P1E59, P1E5A, P1E5B, P1E5C, P1E5D, P1E5E, P1E5F, P1E60, P1E61, P1E62, P1E63, P1E64, P1E65, P1E66, P1E67, P1E68, P1E69, P1E6A, P1E6B, P1E6C, P1E6D, P1E6E, P1E6F, P1E70, P1E71, P1E72, P1E73, P1E74, P1E75, P1E76, P1E77, P1E78, P1E79, P1E7A, P1E7B, P1E7C, P1E7D, P1E7E, P1E7F, P1E80, P1E81, P1E82, P1E83, P1E84, P1E85, P1E86, P1E87, P1E88, P1E89, P1E8A, P1E8B

All of the following conditions exist:

- Vehicle in Service Mode, Vehicle ON or Engine Running.
- The hybrid/EV battery energy control module is awake and communicating.
- None of the following DTCs are set; P1A07, P1E8E, P1E8F, P1E90, P1E91, P1E92, P1E93, P1E94, P1E95, P1E96, P1E97, P1E98, P1E99, P1E9A, P1E9B, P1E9C, P1E9D, P1E9E, P1E9F, P1EA0, P1EA1, P1EA2, P1EA3, P1EA4, P1EA5, P1EB1, P1EB2, P1EB3, P1EB4, P1EB5, U2402, U2603, U2604, U2605, U2606, U2617, U2618, U2619, U2620, U2621, U2622, U2623, U2624.
